

METRIC

MIL-STD-2042-7(SH)
Draft Dated 21 May 1999

DEPARTMENT OF DEFENSE
STANDARD PRACTICE

FIBER OPTIC CABLE TOPOLOGY INSTALLATION
STANDARD METHODS FOR
NAVAL SHIPS
(PIERSIDE CONNECTIVITY CABLE ASSEMBLIES AND INTERCONNECTION HARDWARE)

(PART 7 OF 7 PARTS) 1/

DRAFT RELEASED FOR LIMITED USE BY DIRECTION OF COMMANDER,
SPACE AND NAVAL WARFARE SYSTEMS COMMAND

1/ MIL-STD-2042A, dated 11 September 1996, is in effect for shipboard, fiber optic cable plant (FOCP) installations and consists of the basic and six parts: cables, equipment, cable penetrations, cableways, connectors and interconnections, tests. Part 7 of this standard, currently in draft form, addresses cable assemblies (cables with connections on each end) and interconnection hardware for pierside connectivity from the pier interconnection box to the radio room interconnection box onboard ships.

AMSC N/A
DISTRIBUTION STATEMENT A: Approved for public release; distribution is unlimited.

AREA GDRQ

MIL-STD-2042-7(SH)

FOREWORD

1. This Department of Defense Standard Practice is approved for use by the Naval Sea Systems Command, Department of the Navy, and is available for use by all Departments and Agencies of the Department of Defense.

2. Beneficial comments (recommendations, additions, deletions) and any pertinent data which may be of use in improving this document should be addressed to: Commander, Naval Sea Systems Command, SEA 05K5, 2531 Jefferson Davis Highway, Arlington, VA 22242-5160 by using the self-addressed Standardization Document Improvement Proposal (DD Form 1426) appearing at the end of this document or by letter.

3. This standard practice provides detailed information and guidance to personnel concerned with the installation of fiber optic cable topologies on Naval surface ships and submarines. The methods specified herein are not identifiable to any specific ship class or type, but are intended to standardize and minimize variations in installation methods to enhance the compatibility of the installations on all Naval ships.

4. In order to provide flexibility in the use and update of the installation methods, this standard practice is issued in eight parts; the basic standard practice and seven numbered parts as follows:

- Part 1 Cables
- Part 2 Equipment
- Part 3 Cable Penetrations
- Part 4 Cableways
- Part 5 Connectors and Interconnections
- Part 6 Tests
- Part 7 Pierside Connectivity Cable Assemblies and Interconnection Hardware

MIL-STD-2042-7(SH)

1. SCOPE

1.1 Scope. This standard practice provides detailed methods for installing pierside connectivity fiber optic cable assemblies and interconnection hardware.

1.1.1 Applicability. These criteria apply to installations on specific ships when invoked by the governing ship/pier specification or other contractual document. They are intended primarily for new construction; however, they are also applicable for conversion or alteration of existing ships/piers. The rapidly changing state of the art in fiber optic technology makes it essential that some degree of flexibility be exercised in enforcing this document. Where there is a conflict between this document and the ship/pier specification or contract, the ship/pier specification or contract shall take precedence. Where ship design is such that the methods herein cannot be implemented, users shall submit new methods or modifications of existing methods to NAVSEA 05K5 for approval prior to implementation. Similarly, users on pier designs shall submit new methods or modifications of existing methods to SPAWARSSYSCOM PMW-158.

2. REFERENCED DOCUMENTS

2.1 General. The documents listed in this section are specified in sections 3, 4 and 5 of this standard. This section does not include documents cited in other sections of this standards or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements documents cited in sections 3, 4 and 5 of this standard, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards and handbooks. The following specifications, standards and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those listed in the Department of Defense Index of Specifications and Standards (DODISS) and supplements thereto, cited in the solicitation (see 6.2).

DEPARTMENT OF DEFENSE COMMERCIAL ITEM DESCRIPTION (CID)

- EIA/TIA-440 - Fiber Optic Terminology.

(Application for copies should be addressed to Global Engineering Documents, 1990 M Street NW, Suite 400, Washington, DC 20036.)

2.4 Order of precedence. In the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. DEFINITIONS

3.1 General fiber optics terms. Definitions for general fiber optics terms used in this standard practice are in accordance with EIA/TIA-440. Definitions for other terms as they are used in this standard practice are given in the following paragraphs.

3.2 Alignment sleeve, cavity fixed. The cylindrical tube mounted within the detachable socket insert that positions the fiber protruding from the socket terminus fiber with that of the pin terminus.

3.3 Alignment sleeve, terminus fixed. The cylindrical tube mounted onto the socket terminus that positions the fiber protruding from the socket terminus fiber with that of the pin terminus.

3.4 Attenuation dead zone. The distance on an OTDR measurement needed to detect the occurrence of a non-reflective event (such as a splice). At the attenuation dead zone, the OTDR has recovered to the back scatter level.

3.5 Authorized approval. Authorized approval is written approval from the cognizant Government activity.

3.6 Back scatter. The accumulative portions of the optical power along the length of the fiber that is reflected back towards the optical source. When using an OTDR, a 50 meter MQJ (dead zone jumper) is used to provide a stable baseline at the fiber back scatter level.

3.7 Cable assembly. A fiber optic cable terminated with connectors on each end. The fiber optic assembly also may be referred to as a terminated cable run. A fiber optic assembly can be any of the following: an umbilical assembly (cable with a hermaphroditic cable plug on each end), pigtail assembly (cables with a hermaphroditic, hermaphroditic receptacle on one end and ST connectors on the other end), or terminated shipboard cables (cable with termini on one end and either termini or ST connectors on the other end).

3.8 Communication link. The transmitter, receiver and interconnecting fiber optic cable assemblies. The most basic link is a point-to-point link, which consists of a transmitter, receiver and interconnecting optical fiber (one cable link). All communication systems can be broken down into sets of point-to-point fiber optic communication links.

3.9 Composite cables. Cables that contain both optical fibers and metallic conductors intended for communications use.

3.10 Cross connect assembly. A cable "adapter" used when a nested ship is facing the opposite direction as the other ship(s) moored at that berth. The cable corrects the pinout configuration to that of ships nested in the same direction.

3.11 Detachable socket insert. A front, removable portion of the connector insert or front surface that allows easy access for cleaning of the socket terminus, ferrule end face.

3.12 End-to-end cable link. Two or more fiber optic cable assemblies comprising the optical path to carry optical data streams from one point (such as an interconnection box) to another.

3.13 End user equipment. End user equipment refers to any cabinet, case, panel, or device; that contains components that are either the origin or destination of an optical signal.

3.14 Event dead zone. The distance on an OTDR measurement needed to detect the occurrence of a reflective event (such as a connector) or the distance to resolve two separate events (such as two connection interfaces). At the event dead zone, the OTDR has not recovered to the back scatter level. The signal heights of two reflective events still interfere with one another. This will introduce an error into the measurement.

3.15 Hermaphroditic connector. A hermaphroditic connector is a connector in which cable plugs are able to mate with one another. The term hermaphroditic connector is used in this standard when referring to either/both the hermaphroditic cable plug and hermaphroditic receptacle.

3.16 Hermaphroditic cable plug. The cable plug is the component that mates with a hermaphroditic receptacle when the cable plug is in the forward position. Being hermaphroditic, the cable plug (see figure 7-1) also is used to concatenate umbilical assemblies when one cable plug is in the forward position (female threads exposed) and the mating cable plug is in the back position (male threads exposed). The hermaphroditic style connector is intended for use in concatenation as opposed to point-to-point applications.

Hermaphroditic Cable Plug in Back Position

Hermaphroditic Cable Plug in Forward Position

FIGURE 7-1. Hermaphroditic cable plug.

3.17 Hermaphroditic receptacle. The hermaphroditic receptacle (see figure 7-2) is used at the interconnection box or panel, and is designed to mate with a cable plug in the forward position. The hermaphroditic receptacle itself is not hermaphroditic, but is compatible for mating with the hermaphroditic cable plug.

FIGURE 7-2. Hermaphroditic receptacle.

3.18 Hybrid cables. Cables that contain more than one size and/or type of optical fiber.

3.19 Installing activity. An installing activity is any military, commercial, or industrial organization involved with the installation of fiber optic cables and connections aboard Naval ships or at Navy piers.

3.20 Interconnection hardware. The fiber optic components found at the ends of cable assemblies that mechanically seals, protects or positions and/or that optically aligns the connections at the ends of the cable assemblies. Interconnection hardware include interconnection boxes, patch panels, cabinets, stuffing tubes and ST-to-ST adapters.

3.21 Loss budget. The allocation of optical losses within a fiber optic communications link. These losses include component losses (cables, connectors, etc.), optical power penalties and other performance degradations (such as environmental losses), and an optical margin for unforeseen or unpredictable changes within the communications link.

3.22 MQJ (Measurement Quality Jumper). A low loss cable link or "test jumper" used as part of an optical test measurement. Use of an MQJ ensures that an installed cable link being tested that has a marginal or unacceptable optical attenuation/reflectance value will not be masked by a poor optical quality (high attenuation or reflectance) test jumper.

3.23 Optical fiber cable component (OFCC). An OFCC is a buffered fiber augmented with a concentric layer of strength members and an overall jacket. See single-fiber cable.

3.24 ORL (Optical Return Loss). The accumulative portions of the optical power at each connection interface and the back scatter that is reflected back towards the optical source. This accumulative, returned optical power, measured from the transmission equipment, is performed at the system level to verify that the assemblage of cable links is acceptable. The ORL is the opposite of the reflected optical gain (loss is opposite of gain) and is calculated as a positive value.

3.25 Pierside cable. A fiber optic cable comprised of 12 single-fiber cables under a double layer, polyurethane outer jacket. This multifiber cable (see figure 7-3) is a hybrid cable containing 8 multimode fibers and 4 single mode fibers. When part of the umbilical assembly, this cable is referred to as umbilical assembly cable.

FIGURE 7-3. Pierside cable construction.

3.26 Pierside connectivity fiber optic cable assemblies and interconnection hardware. The fiber optic cables, connectors, interconnection boxes and patch panels, and other passive components that comprise the optical path to carry optical data streams from/to the interconnection box at the pier to/from the radio room onboard the ship (see figure 7-4).

FIGURE 7-4. Pierside connectivity cable layout: pier-to-ship.

3.27 Pigtail assembly (see figure 7-5). A cable link found at the pier interconnection box that interfaces with the pier-to-ship umbilical assembly. This cable link has a hermaphroditic receptacle at one end and ST connectors at the other end. The hermaphroditic receptacle mates with the umbilical assembly. The ST connectors allow patching, when required, at the pier interconnection box.

FIGURE 7-5. Pigtail Assembly.

3.28 Reflectance. The portion of the optical power at one connection interface that is reflected back towards the optical source. This returned optical power at each connection interface is used to determine if the reflectance of each connector is acceptable. Reflectance is the optical gain in a direction opposite that of the forward signal and is measured as a negative value.

3.29 RQJ (Reference Quality Jumper). A low loss cable link or "test jumper" used to measure the optical performance of a candidate MQJ. Depending on the type RQJ, the optical performance requirements are the same as or more stringent than that of the comparable MQJ.

3.30 Single-fiber cable. A buffered fiber augmented with a concentric layer of strength members and an overall jacket. Also, the individual single-fiber cables inside the outer jacket of a multiple fiber cable.

3.31 Termination. The process of placing a fiber optic connector on the end(s) of a fiber optic cable. This process also may be referred to as connector installation, fabrication or assembly.

3.32 Umbilical assembly. The detachable, not permanently installed, cable link used to provide a fiber optic connection between the pier and the ship(s). The umbilical assembly (see figure 7-6) consists of a 500 foot, fiber optic cable with a hermaphroditic connector (cable plug) on each end and spooled onto a three flanged cable reel.

FIGURE 7-6. Umbilical Assembly.

4. GENERAL REQUIREMENTS

4.1 Fiber optic cable connection. Fiber optic connectors shall be used on the ends of the pierside connectivity cable assemblies (see 3.7) for connections between cable assemblies.

4.1.1 Connection component selection. The connection components shall be those referenced in ship/pier specifications and drawings. In those instances where the installing activity (see 3.19) is responsible for determining the correct components, they shall be selected in accordance with 4.2 and 4.3.

4.2 Fiber connectors. Fiber optic connectors shall be as follows:

- a. Shipboard single terminus (light duty) connectors in accordance with MIL-C-83522/16 shall be used to interconnect two optical fiber cable components (OFCC's) inside an interconnection box or equipment. ST connectors used at the pier shall be in accordance with NAVSEA DWG 7325760.
- b. Hermaphroditic, multiple terminus (heavy duty) connectors in accordance with CID A-A-XX159 shall be used to interconnect the umbilical assembly to both the pier and the ship.

4.2.1 Installation. Connectors shall be installed on cables in accordance with the methods herein and as follows:

- a. The connector pinout of each hermaphroditic cable plug or receptacle shall be in accordance with the approved drawings.
- b. Where a hermaphroditic connector is installed on the end of a cable, every terminus position shall contain an optical terminus in accordance with CID A-A-XX160.
- c. Hermaphroditic receptacles shall be used at the port and starboard interconnection boxes aboard ships. Pigtail assemblies in accordance with NAVSEA DWG 7325760 shall be used at the pier interconnection box.

4.3 Fiber optic splices. Fiber optic splices shall not be used during initial installation for pierside connectivity connections.

4.4 Tests. Following installation, testing of all components of the pierside connectivity cable assemblies shall be in accordance with Parts 7F and 7I of this standard practice.

4.5 Safety precautions. The following safety precautions apply:

- a. Observe all written safety precautions given in the methods of this standard practice.
- b. Observe all warning signs on equipment and materials.
- c. The classification of a laser is based on the ability of the optical beam to cause damage to the eye. Under normal operating conditions, an optical fiber communication system (OFCS) is inherently an eye safe system; but, when an optical fiber connection is broken and optical viewing instruments are used, it is possible that hazardous energy can enter the eye. For this reason four service group hazard classes have been devised to indicate the degree of hazard and required hazard control measures. Refer to ANSI Z136.2 for a full technical definition. The following laser safety precautions shall apply:
 - (1) Ensure personnel are familiar with the laser degree of hazard and the required control measures.
 - (2) Light generated by light emitting diodes (LED's) and laser diodes may not be visible but may still be hazardous to the unprotected eye. Never stare into the end of an optical fiber connected to an LED or laser diode and do not stare into broken, severed or disconnected optical cables.
 - (3) Do not view the primary beam or a specular reflection from an OFCS with an optical microscope, eye loupe or other viewing instrument. The instrument may create a hazard due to its light gathering capability.

- d. Safety glasses shall be worn when handling bare fibers. Always handle cable carefully to avoid personal injury. The ends of optical fibers may be extremely sharp and can lacerate or penetrate the skin or cause permanent eye damage if touched. If the fiber penetrates the skin, it most likely will break off, in which case the extraction of the fiber should be performed by trained medical personnel to prevent further complications.
- e. Wash hands after handling bare fibers or performing fiber terminations.

5. DETAILED REQUIREMENTS

5.1 Hermaphroditic connector installation. Installation of the CID A-A-XX159 hermaphroditic connector on fiber optic cable shall be in accordance with Method 7A1.

5.1.1 Termini on shipboard cable OFCC ends. Method 7A1-1 shall be used to install the connector and place termini on the ends of shipboard cable OFCCs.

5.1.2 Pigtail assembly. Method 7A1-1 shall be used to place termini on the ends of pigtail assemblies and on the end of shipboard cables at the port and starboard interconnection boxes.

5.1.3 Umbilical assembly. Method 7A1-2 shall be used to install the hermaphroditic cable plug onto each end of the umbilical assembly.

5.2 Light duty connector installation. Light duty connectors in accordance with MIL-C-83522/16 (for shipboard installations) or NAVSEA DWG 7325760 (for pier interconnection box installations) shall be installed on fibers in accordance with Method 5B1.

5.3 Shipboard connector pinout and patching positions (wiring diagram).

5.3.1 Configurations. The fibers to be placed into the hermaphroditic receptacle and the patch panel configuration in the radio room will depend on the network configuration installed on the ship. Three network configurations are specified: Ethernet/ADNS 2.0, ADNS 2.1, and Future.

5.3.1.1 Version I. Connector pinout and patch panel configuration at the radio room shall be in accordance with Table 7-I for multimode cables and Table 7-II for single mode cables. Version I includes Ethernet and ADNS 2.0 network configurations.

5.3.1.2 Version II. Connector pinout and patch panel configuration at the radio room shall be in accordance with Table 7-III for multimode cables and Table 7-IV for single mode cables. Version II includes the ADNS 2.1 configuration.

5.3.1.3 Version III. Connector pinout and patch panel configuration at the radio room shall be in accordance with Table 7-V for multimode cables and Table 7-VI for single mode cables. Version III supports future configurations.

NOTE: The umbilical assembly for Version III must be configured with a cable containing 6 multimode and 6 single mode optical fibers.

NOTE: The following abbreviations are used in Tables 7-I through 7-VI:
Port-1J = port interconnection box hermaphroditic receptacle position 1J.
STBD-3P= starboard interconnection box hermaphroditic receptacle position 3P.
N/C = no connection.
P/P = patch panel in ships' radio room interconnection box.
P/P-46 = ST-to-ST adapter port position 46 on the patch panel.

5.3.2 Fiber designations. Fiber designations for each multimode and single mode cable are listed in Tables 7-I through 7-VI.

5.3.3 Radio room patch panel layout (see figure 7-7). Ports 41, 48, 89 and 96 should be labeled TX or transmit, ports 42, 47, 90 and 95 should be labeled RX or receive. The patch cord from the network is to be placed either in 89 and 90 or in 95 and 96, depending on which side of the ship is expected to face the pier. Patch panel layout is as follows:

- a. Top four rows – starboard interconnection box cables.
- b. Bottom four rows – port interconnection box cables.
- c. Top two rows (starting with ports 41 and 42) – multimode cables from the starboard interconnection box.

- d. Next two rows from the top (starting with ports 43 and 44) – single mode cables from the starboard interconnection box.
- e. Bottom two rows (starting with ports 47 and 48) – multimode cables from the port interconnection box.
- f. Next two rows from the bottom (starting with ports 45 and 46) – single mode cables from the port interconnection box.

NOTE: Rows 5 through 8 are a mirror image of rows 1 through 4.

FIGURE 7-7. Patch panel designation for NAVSEA Drawing 7325761, Item 0346 ships radio room interconnection box.

5.3.4 Hermaphroditic connector pinout designations. The pinout locations, looking into the connector are shown in Figure 7-8.

- a. The number identifies the pin or socket location number.
- b. J identifies the location as a socket (jack) location.
- c. P identifies the location as a pin location.

FIGURE 7-8. Hermaphroditic connector pinout designations.

5.4 Shipboard interconnection box placement guidelines.

5.4.1 Cleanliness considerations. Cleanliness is a prime consideration to reduce termini cleaning requirements with this fiber optic, umbilical assembly connection. Select a location for the shipboard interconnection boxes so that hermaphroditic receptacle is not directly exposed to the weather or excessive dirt/dust.

5.4.2 Description of the two pierside connectivity installation schemes. There are two pierside connectivity installation schemes that determine the number and placement of the interconnection boxes. Selection is based on the ship class.

- a. Installation A (see figure 7-9). This pierside connectivity installation is used for larger classes of surface ships. These ships have a midship distance between the port and starboard hatch/ship entry point that is greater than 50 feet. This installation scheme places an interconnection box with a hermaphroditic receptacle at midships, both port and starboard, and an interconnection box with a patch panel in the radio room. Shipboard cable runs identified in 5.3.1 are made among these three interconnection boxes. The fiber optic components for installation A, less cable, are identified as the Installation A Kit (formerly "Surface Ship Kit") in NAVSEA Drawing 7325762.

FIGURE 7-9. Installation "A" shipboard layout.

- b. Installation B (see figure 7-10). This pierside connectivity installation is used for smaller classes of surface ships (such as FFG's, DDG's, CG's and DD's) and for submarines. These surface ships have a midship distance between the port and starboard hatch/ship entry point that is less than 50 feet. This installation scheme places one interconnection box with two hermaphroditic receptacles at a "central" location (midships for surface ships, at the sail for submarines) and an interconnection box with a patch panel in the radio room. Shipboard cable runs identified in 5.3.1 are made between these two interconnection boxes. This configuration is identified as the Installation B Kit (formerly "Submarine Kit") in NAVSEA Drawing 7325762.

FIGURE 7-10. Installation "B" shipboard layout.

5.4.3 Installation A guidance.

- a. Place the interconnection boxes with hermaphroditic receptacles midship, at port and starboard locations not directly exposed to the weather.
- b. Determine the umbilical assembly routing to the port/starboard interconnection box.
 - (1) If the umbilical assembly is to be routed such that the hermaphroditic cable plug approaches the interconnection box off the deck, place the hermaphroditic receptacle on the bottom of the interconnection box.
 - (2) If the umbilical assembly is to be routed such that the hermaphroditic cable plug approaches the interconnection box from the overhead, place the hermaphroditic receptacle on the top of the interconnection box.
- c. Installation height of the port and starboard interconnection boxes shall permit easy access to the hermaphroditic receptacle. This access is required for cleaning and connecting to the hermaphroditic cable plug on the umbilical assembly.

5.4.4 Installation B guidance for surface ships.

- a. Place the interconnection boxes with the two hermaphroditic receptacles midship, at a location not directly exposed to the weather.
- b. Determine the umbilical assembly routing to the midship interconnection box.

NOTE: Preferred routing of the umbilical assembly approach to the interconnection box is through or close to the overhead, when feasible.

NOTE: Locating the hermaphroditic receptacle on the top or bottom of the interconnection box is recommended to eliminate a sharp bend and minimize danger.

- (1) If the umbilical assembly is to be routed such that the hermaphroditic cable plug approaches the interconnection box off the deck, place the hermaphroditic receptacle on the bottom of the interconnection box.
- (2) If the umbilical assembly is to be routed such that the hermaphroditic cable plug approaches the interconnection box from the overhead, place the hermaphroditic receptacle on the top of the interconnection box.
- c. Installation height of the midship interconnection box shall permit easy access to the hermaphroditic receptacle. This access is required for cleaning and connecting to the hermaphroditic cable plug on the umbilical assembly.

5.4.5 Installation B guidance for submarines.

- a. Place the interconnection boxes with the two hermaphroditic receptacles at the sail/rear escape hatch.
- b. Determine the umbilical assembly routing to the interconnection box inside the sail/at the rear escape hatch.

NOTE: Planned routing of the umbilical assembly approach to the interconnection box is through the sail. This is the preferred approach. Shore power is routed through the rear escape hatch; however, this hatch is secured when rough seas are encountered while at the pier. The hatch at the sail remains open which allows for uninterrupted shore communication through the umbilical assembly.

NOTE: Locating the hermaphroditic receptacles on the top of the interconnection box is recommended to eliminate a sharp bend and minimize damage.

- c. Installation location of the sail/rear escape hatch interconnection box shall permit easy access to the hermaphroditic receptacle. This access is required for cleaning and connecting to the hermaphroditic cable plug on the umbilical assembly.

5.4.6 Routing for port to starboard cable runs.

- a. Installation A. Route directly from port interconnection box to starboard interconnection box.
- b. Installation B. Use jumpers internal to interconnection box to simulate port to starboard routing.

5.4.7 Shipboard Interconnection box footprint and mounting dimensions.

- a. MIL-I-24728/1 interconnection box footprint.

- (1) Length (across): 343 mm (13.5 inch) maximum.
- (2) Width (vertical): 457 mm (18.0 inch) maximum.
- (3) Depth: 195 mm (7.75 inch) maximum.

- b. MIL-I-24728/1 interconnection box mounting dimensions. Mounting dimensions are shown in figure 7-11.

FIGURE 7-11. Shipboard interconnection box mounting dimensions.

Notes:

1. Dimensions are in millimeters. Equivalent inch conversions are provided below.

mm	inches
117.6	4.63
145.3	5.72
235.0	9.25
290.6	11.44

2. Unless otherwise specified, tolerance is ± 0.3 mm (± 0.01 inches).
3. Mounting hole shall accommodate a M12.7 X 1.95 (0.5-13) bolt.

5.5 Pier interconnection box placement guidelines.

5.5.1 Pier configuration. Select potential locations for mounting the interconnection box based on type of pier configuration and availability of utility enclosures at the pier (see Table 7-VII).

TABLE 7-VII. Pier configuration.

Pier Configuration	Interconnection box Location
Single deck pier with utility trench	a. Preference. Mount inside existing utility enclosure. b. Alternate. Mount in semi protected area with easy reach for connection & cleaning. c. Less desirable. Mount on side of trench just below deck.
Single deck pier with service utility enclosure available.	a. Preference. Mount inside utility enclosure. b. Less desirable. Attach to utility enclosure outside surface.
Single deck pier with no available utility trench or service utility enclosure	a. Preference. Install utility enclosure and mount inside. b. Alternate. Mount low on surface of pier deck, away from any traffic
Double deck pier	Mount on lower pier

Note: Keep any unprotected interconnection box mounted on the pier deck low and away from any traffic.

Note: Plan for flexibility with pier interconnection box locations. More than one interconnection box may be placed along each pier to service a mixture of ship classes, docking configurations, etc.

5.5.2 Cleanliness considerations. Cleanliness is a prime consideration to reduce termini cleaning requirements with this fiber optic connection at the hermaphroditic receptacle. Select a location for the shipboard interconnection boxes with the hermaphroditic receptacle that is not directly exposed to the weather or excessive dirt/dust. When feasible, it is preferable to locate the fiber optic interconnection box inside another enclosure. Where no existing enclosure is available, a separate enclosure on the pier can be installed into which the interconnection box is placed. A 3 inch conduit fitting can be installed on the side of the enclosure adjacent to the hermaphroditic receptacle on the interconnection box. This conduit fitting would permit easy access to the hermaphroditic receptacle. A 3 inch conduit cap should be included to cover the conduit opening when an umbilical assembly is not connected to the hermaphroditic receptacle.

5.5.3 Pier interconnection box footprint and mounting dimensions.

- a. NAVSEA DWG 7325761, item 6003 AK interconnection box footprint.
 - (1) Length (across): 381 mm (15.0 inch) maximum
 - (2) Width (vertical): 495 mm (19.5 inch) maximum
 - (3) Depth: 222 mm (8.75 inch) maximum
- b. NAVSEA DWG 7325761, item 6004AK interconnection box mounting dimensions. Mounting dimensions are shown in figure 7-12.
- c. NAVSEA DWG 7325761, item 6003AE interconnection box footprint.
 - (1) Length (across): 432 mm (17.00 inch) maximum
 - (2) Width (vertical): 413 mm (16.25 inch) maximum
 - (3) Depth: 146 mm (5.75 inch) maximum
- d. NAVSEA DWG 7325761, item 6003AE interconnection box mounting dimensions. Mounting dimensions are shown in figure 7-13.

FIGURE 7-12. Mounting dimensions for item 6003AK pier interconnection box.

Notes:

1. Dimensions are in centimeters. Equivalent inch conversions are provided below.

cm	inches
2.31	0.91
23.57	9.28
38.00	14.96
46.63	18.36

2. Unless otherwise specified, tolerance is ± 0.03 cm (± 0.01 inches).
3. Mounting hole shall accommodate a 0.25-20 bolt.
4. Mounting holes are offset from interconnection box center to permit installation after a conduit is installed.
5. Use stabilizer bracket only for pole mounting or if placing on a less substantial support such as dry wall.

FIGURE 7-13. Mounting dimensions for NAVSEA Drawing 7325761, item 6003 AE pier interconnection box.

Notes:

1. Dimensions are in centimeters. Equivalent inch conversions are provided below.

cm	inches
0.32	0.13
0.66	0.26
0.74	0.29
10.79	4.25
16.20	6.38
21.59	8.50
32.39	12.75

2. Unless otherwise specified, tolerance is ± 0.03 cm (± 0.01 inches).

3. Mounting hole shall accommodate a 0.25-20 bolt.

5.5.4 Pier interconnection box usage (sealed versus vented configuration).

- a. NAVSEA DWG 7325761, item 6003AK interconnection box. This interconnection box is a sealed interconnection box configuration and offers protection from external environment penetration.
 - (1) Usage. This interconnection box is recommended for general usage.
 - (2) Mounting configuration. Mounting dimensions in Figure 7-12 does not include usage of the stabilizer bracket. The stabilizer bracket allows the interconnection box to be mounted on a pole or on a less substantial backing such as dry wall. Interconnection box mounted inside a utility enclosure is done without the stabilizer bracket.
- b. NAVSEA Drawing 7325761, item 6003AE interconnection box. This interconnection box is a vented interconnection box configuration and should be limited to locations that offer protection from wind gusts and dust/dirt penetration. Mounting dimensions are shown in figure 7-13.
 - (1) Usage. This interconnection box should be restricted to a reasonably clean environment.

5.6 Umbilical assembly routing schemes with ships nested at a berth.

5.6.1 Types of routing schemes. Two different schemes may be employed for umbilical assembly routing from the pier to the ships when the ships are in a nested configuration. The umbilical assembly is a 152 m (500 ft) fiber optic cable on a three flanged cable reel with two fiber optic connectors on the end. This umbilical assembly is used to connect the ship to the pier for shore communications while in port. No more than three ships are to be nesting at any one berth.

- a. **Over-the-deck.** One cable routing scheme is known as over-the-deck (see figure 7-14). In this scheme, a separate umbilical assembly is run from the pier to each ship. The umbilical assembly to the middle ship in the nest is routed over the ship docked at the pier. Similarly, the umbilical assembly to the outermost ship in the nest is routed over the other two ships.

FIGURE 7-14. Over-the-deck routing scheme.

- b. **Through-the-ship.** A second cable routing scheme is known as through-the-ship (see figure 7-15). An umbilical cable is routed from the pier to the ship docked at the pier. A second umbilical assembly is routed from the pierside, docked ship to the middle ship in the nest. A third umbilical assembly is routed from the middle ship to the outermost ship in the nest. This scheme requires that the pierside connectivity cable assemblies support through-the-ship routing and that interface equipment have a robust optical loss budget. This scheme also requires that there is an exterior location on two of the three ships in the nest to place the umbilical assembly cable reel with the unspooled cable length while in use.

FIGURE 7-15. Through-the-ship routing scheme.

5.6.2 Surface ship piers. The through-the-ship cable routing scheme for the umbilical assembly is specified for surface ships in a nested configuration.

5.6.3 Submarine piers. The over-the-ship cable routing scheme for the umbilical assembly is specified for submarines in a nested configuration.

NOTE: Small surface craft (patrol boats, etc.) may elect to use this routing scheme.

5.7 Number of pigtail assemblies per pier interconnection box.

5.7.1 Pier interconnection box at surface ship berth. The interconnection box is to contain one pigtail assembly. One pigtail assembly per interconnection box permits surface ships in a nested configuration to employ the through-the-ship cable routing scheme for the umbilical assembly.

5.7.2 Pier interconnection box at submarine berth. The interconnection box is to contain three pigtail assemblies. This quantity of pigtail assemblies per interconnection box permits submarines in a nested configuration to employ the over-the-deck cable routing scheme for the umbilical assembly.

5.8 Pier interconnection box patch panel designations.

5.8.1 NAVSEA DWG 7325761, item 6003AK interconnection box. There are no designations inscribed on the patch panel. The interconnection box cover has a label with designations for the patch panel layout (see figure 7-16).

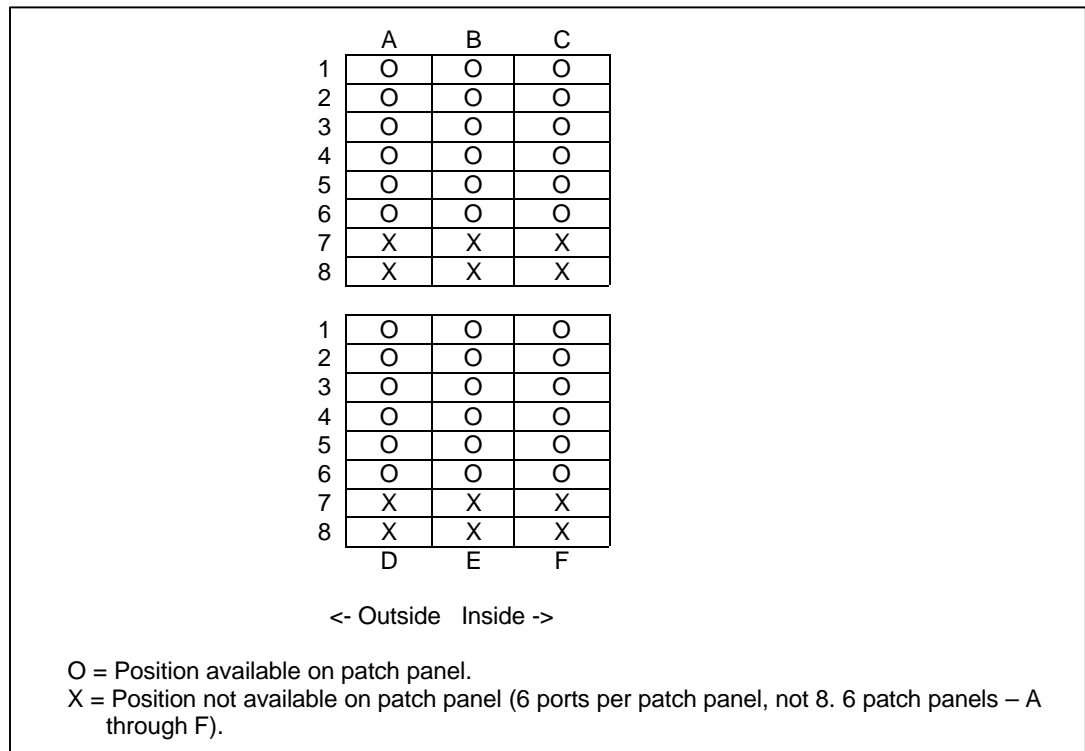

FIGURE 7-16. Patch panel designations for item 6003AK pier interconnection box.

5.8.2 NAVSEA Drawing 7325761, item 6003AE interconnection box. Patch panel designations for the ST-to-ST adapter locations are silk screened onto the patch panel (see figure 7-17).

FIGURE 7-17. Patch panel designations for NAVSEA Drawing 7325761, item 6003AE pier interconnection box.

5.9 Pier interconnection box patching positions.

5.9.1 Pier patch panel layout. Patch panel layout is provided for the NAVSEA Drawing 7325761, item 6003AK interconnection box. There are six patch panels, designated A through F (see figure 7-16). Each patch panel consists of one column containing six ports. Patch panel layout is as follows:

- a. Pigtail assembly ST connectors, for the ship docked at pierside (ship 1), are placed on the outermost patch panels (patch panels A and D).
- b. Pigtail assembly ST connectors, for the middle ship (ship 2), are placed on the center patch panels (patch panels B and E).
- c. Pigtail assembly connectors, for the outermost ship in the nest (ship 3), are placed on the most inward patch panels (patch panels C and F).
- d. When one pigtail assembly is used for the through-the-ship umbilical assembly routing scheme, connect the pigtail assembly ST connectors to the corresponding ports for each of the three ships (see Table 7-VIII, 7-X or 7-XII).

5.9.2 Configurations. The ST connectors from the pigtail assembly are patched into the applicable ST-to-ST adapter patch panel positions depending on the network configuration installed on the ship. Three network configurations are specified: Ethernet/ADNS 2.0, ADNS 2.1, and Future.

5.9.2.1 Version I. Patch panel configuration at the pier interconnection box shall be in accordance with Table 7-VIII for the through-the-ship umbilical assembly cable routing scheme and Table 7-IX for the over-the-deck umbilical assembly cable routing scheme. Version I includes Ethernet and ADNS 2.0 network configurations.

5.9.2.2 Version II. Patch panel configuration at the pier interconnection box shall be in accordance with Table 7-X for the through-the-ship umbilical assembly cable routing scheme and Table 7-IV for the over-the-deck umbilical assembly cable routing scheme. Version II includes the ADNS 2.1 configuration.

5.9.2.3 Version III. Patch panel configuration at the pier interconnection box shall be in accordance with Table 7-XII for the through-the-ship umbilical assembly cable routing scheme and Table 7-XII for the over-the-deck umbilical assembly cable routing scheme. Version III supports future configurations.

NOTE: The pigtail assembly for Version III must be configured with 6 multimode and 6 single mode optical fibers.

NOTE: The following abbreviations are used in Tables 7-VIII through 7-XIII:
Pigtail 3 = interconnection box hermaphroditic receptacle for third (outermost) ship in the nest.
Pigtail 3-3P = hermaphroditic receptacle position 3P.
N/C = no connection.
P/P = patch panel in pier interconnection box.
P/P-4C = ST-to-ST adapter port position 4C on the patch panel.

5.9.3 Alternate pier patch panel layout. This patch panel layout is provided for the NAVSEA Drawing 7325761, item 6003AE interconnection box. There is one patch panel with 24 ports, designated ports 1 through 24 (see figure 7-17). This layout covers patch panel configurations for Versions I and II only. Patching is set up for the multimode ST connectors on the pigtail assembly. Single mode ST connectors are not connected. Patch panel layout is as follows:

- a. Pigtail assembly connections, for the ship docked at pierside (ship 1), are placed on rows 1 and 2 (port 1 to 8). Designate port 1 for 1P, port 2 for 1J, port 3 for 2P, etc.
- b. Pigtail assembly connections, for the middle ship (ship 2), are placed on rows 3 and 4 (ports 9 to 16). Designate port 9 for 1P, port 10 for 1J, port 11 for 2P, etc.
- c. Pigtail assembly connections, for the outermost ship in the nest (ship 3), are placed on rows 5 and 6 (ports 17 to 24). Designate port 17 for 1P, port 18 for 1J, port 19 for 2P, etc.
- d. When one pigtail assembly is used for the through-the-ship umbilical assembly routing scheme, connect the pigtail assembly ST connectors to the corresponding ports for that ship. For example, ST connector on Pigtail-3P (see Table 7-VIII) is designated for ship 3 and is connected to port 18 for a Version I configuration. Table 7-VIII or Table 7-X may be used for guidance.

6. NOTES

(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use. The methods for installation of connectors and interconnections depicted in this standard practice are intended primarily for new construction; however, they are applicable for conversion or alteration of existing ships.

6.2 Issue of DODISS. When this standard practice is used in acquisition, the applicable issue of DODISS must be cited in the solicitation (see 2.2.1).

6.3 Standard method designation. To simplify the usage of this standard practice, an alpha-numeric designation system was developed to identify and locate a given method. The methods were grouped together by function as follows:

Group A:	Hermaphroditic connector termination
B:	Shipboard interconnection box placement and interior cable routing
C:	Umbilical assembly cable tiedown guidelines and supplemental practices
D:	Umbilical assembly cable spooling operations
E:	Cleaning and mating the hermaphroditic connector
F:	Optical testing of pierside connectivity cable components
G:	Pier interconnection box installation.
H:	Hermaphroditic connector positions, mating and concatenation.
I:	Optical return loss testing of pierside connectivity cable assemblies.
J:	Optical acceptance testing of pierside connectivity measurement quality jumpers.

Then the designation system was completed as follows:

Thus, method 7A1-2 identifies the second alternate procedure within method 1 of group A in Part 7 (MIL-STD-2042-7) of MIL-STD-2042.

6.4 Subject term (key word) listing.

Fiber optic cable assembly
Fiber optic interconnection hardware
Hermaphroditic connector
Pierside connectivity
Safety

Preparing activity:
NAVY - SH
(Project GDRQ-N169-5)

METHOD 7A1

HERMAPHRODITIC CONNECTOR TERMINATION

1. SCOPE.

1.1 Scope. This method describes procedures for installing CID A-A-XX160 pin and socket termini onto pierside or shipboard cable and for assembling CID A-A-XX159 hermaphroditic cable plugs and hermaphroditic receptacles. Method 7A1-1 covers installation of termini onto shipboard cable and method 7A1-2 covers installation of the hermaphroditic cable plug onto each end of an umbilical assembly.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

- a. Safety glasses shall be worn at all times when handling bare fibers or dispensing epoxy.
- b. Do not touch the ends of the fiber as they may be razor sharp. Wash your hands after handling bare fiber.
- c. Avoid skin contact with epoxies.
- d. Do not stare into the end of a fiber until verifying that the fiber is not connected to a laser light source or LED.

3.2 Procedure I. Method 7A1-1. Installation of termini onto shipboard cable. Method 7A1-1 describes procedures for the installation of termini onto the end of shipboard cable, and termini insertion into the jam nut mounted receptacle.

3.2.1 Equipment and materials. The equipment and materials in table 7A1-I shall be used to perform this procedure:

TABLE 7A1-I. Equipment and materials.

Description	Quantity
Wipes (NAVSEA DWG 6872813-22 or equal)	As required
Ruler	1
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required
Cable jacket stripping tool (NAVSEA DWG 6872813-8 or equal)	1
Masking tape	As required
Kevlar shears (NAVSEA DWG 6872813-16 or equal)	1
OFCC strip tool (NAVSEA DWG 6872813-10 or equal)	1
Safety glasses	1
Buffer strip tool (NAVSEA DWG 6872813-9 or equal)	1
Cleaning wire (NAVSEA DWG 6872813-32 or equal)	As required
Epoxy (MIL-A-24792)	As required
Syringe with dispensing needles (NAVSEA DWG 6872813-27 or equal)	As required
Crimp tool (NAVSEA DWG 6872813-17 or equal)	1
Razor blade	1
Cure adapters (NAVSEA DWG 6872813-19 or equal)	As required
Curing oven (NAVSEA DWG 6872813-19 or equal)	1
Cable stand (NAVSEA DWG 6872813-19 or equal)	1
Cable stand ring (NAVSEA DWG 6872813-19 or equal)	1
Cable clip (NAVSEA DWG 6872813-19 or equal)	1

TABLE 7A1-1. Equipment and materials (continued).

Description	Quantity
Cleaver (NAVSEA DWG 6872813-7 or equal)	1
Polishing paper (5 µm aluminum oxide, foam backed) (NAVSEA DWG 6872813-24 or equal)	As required
Polishing tool ceramic termini (NAVSEA DWG 6872813-18 or equal)	1
Terminus insertion tool (NAVSEA DWG 6872813-2 or equal)	1
Terminus insertion tool 90° (NAVSEA DWG 6872813-15 or equal)	1
Polishing paper (0.1 µm diamond, mylar backed) (NAVSEA DWG 6872813-41 or equal)	As required
Resilient pad (70 to 90 durometer)(NAVSEA DWG 6872813-42 or equal)	1
Glass polishing plate (NAVSEA DWG 6872813-3 or equal)	1
7X eye loupe	1
Polishing paper (1 µm aluminum oxide, mylar backed) (NAVSEA DWG 6872813-23 or equal)	As required
Water bottle (sealable type)	1
Terminus removal tool (NAVSEA DWG 6872813-6 or equal)	1
Optical microscope 400X (NAVSEA DWG 6872813-28 or equal)	1
Alignment sleeve insertion and removal tool (ceramic termini)(NAVSEA DWG 6872813-4 or equal)	1
Loctite or equal	As required
"O"-ring lubricant (Bray Cote 609 or equal)	As required
Adjustable wrench	1
Protective caps (plastic)	As required

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

NOTE: Verify that the epoxy shelf life has not expired. Do not use epoxy with an expiration date that has passed.

3.2.2 Cable preparation.

Step 1 - Ensure that the proper cable is used. The 8 fiber, multimode cable is M85045/17-01P. The 8 fiber, single mode cable is marked M85045/17-02P.

Step 2 - Measure the cable to the required length.

NOTE: Make sure to include the 6 ft inside the box strip back length at each end of the cable.

Step 3 - Clean at least 1.8 m (6 ft) of the outer cable jacket that will be removed using a wipe dampened with alcohol and blow it dry with air.

NOTE: Keep the cable, connector parts and termini free from oil, dirt and grease throughout the installation procedure. If cleaning is necessary, use a wipe dampened with alcohol and blow the part dry with air.

Step 4 - **CAUTION:** Do not cut or nick the OFCC jackets.

Mark the cable jacket approximately 1.8 m (6 ft) from the end and strip back the outer cable jacket to the mark using the cable stripper. Fold back the arimid yarn strength members and temporarily tape them to the cable outer jacket.

Step 5 - Cut off the exposed central strength member and any fillers using the kevlar (arimid yarn) shears.

Step 6 - Remove any water blocking material, clean the OFCC's using a wipe dampened with alcohol and blow them dry with air.

Step 7 - Trim arimid yarn strength members, using kevlar shears, to be flush with the cable's outer jacket.

3.2.3 Fiber preparation.

Step 1 - Feed each OFCC into a crimp sleeve and slide the sleeve back from the end of the OFCC.

NOTE: Only use crimp sleeves intended for termini. Do not use crimp sleeves intended for other types of connectors. The standard crimp sleeve for the terminus may be oriented in either direction.

Step 2 - Trim the OFCC's to dimension A in table 7A1-II using the kevlar shears (see figure 7A1-1).

Step 3 - Remove the OFCC jackets back to dimension B in table 7A1-II using the OFCC stripper.

Step 4 - Trim the arimid yarn on the OFCC so that approximately 3 mm (0.12 in) extends past the OFCC jacket.

FIGURE 7A1-1. Cable stripping dimensions.

TABLE 7A1-II. Cable stripping dimensions.

InterconnectionBox Location	Dimensions		
	A m (ft)	B mm (in)	C mm (in)
Port/Starboard	1.8 (6)	30 (1.2)	19 (0.75)
Radio Room	0.9 (3)	30 (1.2)	19 (0.75)

Step 5 - WARNING: Wear safety glasses when removing the fiber buffer and coating to avoid possible eye injury.

Remove the fiber buffers and coatings back to dimension C in table 7A1-II using the buffer stripper. Remove the buffer and coating in small sections (approximately 6 mm (0.25 in) at a time.)

NOTE: Normally, the buffer and coating are tightly adhered to one another and come off of the fiber at the same time.

Step 6 - CAUTION: The uncoated fiber is in its most vulnerable state. Take extreme care not to damage the fiber.

Remove any residual coating material from the bare fibers with a wipe dampened with alcohol. Wipe only once from the end of the buffer towards the end of the fiber. (NOTE: Do not repeatedly wipe the bare fiber as this will weaken the fiber.)

3.2.4 Installation of the termini onto the fibers.

NOTE: This procedure describes the process for installing ceramic termini onto either multimode or single-mode fibers. The termini use epoxy to secure the fiber.

Step 1 - Turn on the curing oven so that it attains the proper temperature before the termini are placed within it (approximately 20 minutes).

Step 2 - Inspect the terminus and verify that the ferrule hole is free and clean of dirt. This can be accomplished by holding the front of the terminus up to a light and verifying that the light is visible from the rear of the terminus. If light cannot be seen through the terminus, push music wire through the terminus hole to clear it. Then blow dry air through the hole to remove any debris.

Step 3 - **CAUTION:** Do not introduce large air bubbles into the epoxy during the mixing process. Large air bubbles in the epoxy can lead to connector failure during temperature extremes.

Remove the divider from a 2-part epoxy package and mix the two parts together until the epoxy is a smooth uniform color (see figure 7A1-2). The epoxy can be mixed by either repeatedly rolling the divider over the package or gently sliding the divider over the package.

NOTE: Alternatively, the epoxy may be mixed by massaging the epoxy package by hand.

FIGURE 7A1-2. Mixing the epoxy.

Step 4 - Install the syringe tip on the syringe, remove the plunger, and squeeze the epoxy into the syringe. Replace the plunger.

Step 5 - **WARNING:** Wear safety glasses while dispensing the epoxy to avoid possible eye injury.

Remove air pockets in the syringe by holding the tip of the syringe upward and dispensing epoxy onto a wipe until it runs free and clear.

Step 6 - Slide the terminus, rear first, onto the syringe tip (see figure 7A1-3). Keeping the syringe vertical, depress the plunger and slowly inject epoxy into the terminus until it escapes out of the ferrule, forming a very small bead. (NOTE: Do not overfill. Be extremely careful not to get epoxy on the pin spring or other terminus moving parts.)

FIGURE 7A1-3. Injecting epoxy into the terminus.

Step 7 - Withdraw the syringe from the terminus. Maintain some pressure on the plunger as the syringe is withdrawn so that the terminus is completely filled with epoxy. Using a wipe dampened with alcohol, wipe away any epoxy on the outer diameter of ferrule without disturbing the epoxy bead.

NOTE: Alternatively, the terminus may be completely filled by maintaining a light pressure on the syringe plunger and allowing the epoxy to push the terminus off of the syringe tip.

Step 8 - Insert the fiber into the rear of the terminus (see figure 7A1-4). Gently work the fiber through the terminus until the buffer seats against the rear of the ferrule. The buffered fiber should come up to the rear of the terminus. Once inserted, do not allow the fiber to slip back.

NOTE: Rotate the fiber as it moves through the connector ferrule. This evenly distributes epoxy around the fiber in the terminus hole.

FIGURE 7A1-4. Inserting the fiber into the terminus.

Step 9 - Slide the crimp sleeve over the kevlar and crimp it to the rear of the terminus using the crimp tool. (NOTE: A small amount of epoxy may be added on the kevlar near the rear of the terminus before the crimp sleeve is installed. However, no epoxy should be visible once the crimp sleeve is installed.)

Step 10 - Verify that the kevlar does not protrude excessively from under the crimp sleeve. Excessive kevlar protrusion will cause the terminus to not seat properly in the finished connector. If excessive kevlar protrudes from under the crimp sleeve, trim it back using a razor blade.

Step 11 - Verify that there is a small amount of epoxy around the fiber where it protrudes from the ferrule. If it is found that there is no small bead of epoxy on the terminus tip, carefully add a small amount of epoxy around the fiber. (NOTE: There should only be a small amount of epoxy around the fiber to support it later during the polishing process. If too much epoxy is around the fiber during the curing process it may cause the fiber to crack.)

Step 12 - Using a wipe dampened with alcohol, carefully wipe away any excess epoxy on the fiber that is more than 2mm (0.08 in) from the ferrule tip surface.

Step 13 - Insert the terminus into the cure adapter until it snaps into place (see figure 7A1-5).

FIGURE 7A1-5. Inserting a terminus in a cure adapter.

Step 14 - Repeat steps 2 through 13 for each fiber to be terminated.

Step 15 - Place the cure adapters in the curing oven, and position the cable vertically over the oven using the cable stand, cable stand ring and cable clip (see figure 7A1-6). Cure the epoxy for a minimum of 10 minutes (maximum of 30 minutes) at 120°C (248°F). (NOTE: When the cable is positioned above the terminus, make sure that no bends are placed in the buffered fibers. Each buffered fiber should enter the terminus parallel to the terminus.)

FIGURE 7A1-6. Termini in the curing oven.

Step 16 - Turn the curing oven off and remove the cure adapters and termini from the curing oven. Allow the cure adapters and termini to cool for approximately 4 minutes.

3.2.5 Polishing the fiber ends.

3.2.5.1 Flat end polish. This procedure will produce a terminus with a flat end polish. This procedure is typically used for multimode applications. Procedures for hand polishing are contained herein. Machine polishing may be used as an alternate method, provided the following requirements are satisfied:

- The manufacturer's instructions will be rigidly adhered to, except that the polishing papers or disks shall be 5 μm aluminum oxide foam backed, 1 μm aluminum oxide mylar backed, and 0.1 μm diamond mylar backed as used in hand polishing. (NOTE: Alternate polishing materials may be used if authorized approval is obtained and the polishing machine includes the appropriate stops to prevent changes to the ferrule length.)
- The machine polished terminus shall undergo the same quality check used for the manually polished terminus as described herein.

NOTE: The procedures contained herein should produce an optical terminus with a physical contact (PC) polish.

Step 1 - **WARNING:** Wear safety glasses when scoring the fiber to avoid possible eye injury.

Remove the terminus from the cure adapter and score the fiber close to the terminus tip at the epoxy interface using one short light stroke with cleaving tool (see figure 7A1-7). (NOTE: Do not break the fibers with the cleaving tool.) Pull off each fiber with a gentle, straight pull. Deposit the waste fiber in a trash container.

FIGURE 7A1-7. Scoring the fiber.

NOTE: The termini not being polished should be left in the cure adapters during the polishing process to protect the fibers from breakage.

NOTE: Before inserting the terminus into the polishing tool, the terminus may be held vertically and the end of the fiber polished off by lightly running the 5 μ m polishing paper over the top of the terminus tip. (This is referred to as air polishing the terminus.)

Step 2 - Rotate the top half of the polishing tool 90 degrees counterclockwise and separate the top from the base.

Step 3 - Place the end of the terminus insertion tool at the rear of the crimp sleeve with the OFCC laid in the tool channel (see figure 7A1-8).

FIGURE 7A1-8. Placing the terminus in the insertion tool.

Step 4 - Insert the terminus into the center of the polishing tool top. Apply pressure with the insertion tool until the terminus snaps into place. Remove the tool by pulling straight back (see figure 7A1-9). (NOTE: Difficulty in inserting the terminus into the polishing tool may indicate epoxy on outside of the terminus which must be removed before proceeding.)

Step 5 - Install the top half of the polishing tool on the bottom half and rotate it clockwise (90 degrees) until it locks in place.

Step 6 - Clean the glass polishing plate, the backs of the polishing papers, and the surface of the polishing tool using a wipe dampened with alcohol. Blow all of the surfaces dry with air.

FIGURE 7A1-9. Inserting the terminus in the polishing tool.

- Step 7 - Place the 5 μm polishing paper on the glass plate and start polishing the terminus with very light pressure (the weight of the tool) using a figure-8 motion. Do not overpolish the terminus. (NOTE: The first polish is complete when all of the epoxy is gone from the tip of the terminus.) Since the polishing time varies with the amount of epoxy present on the tip of the terminus, inspect the terminus tip frequently. Whenever the polishing tool is lifted, remove the grit from the tool and the terminus with air. When polishing is complete, clean the terminus and the polishing tool using a wipe dampened with alcohol and blow them dry with air. Perform a rough inspection of the ferrule end using the eye loop.
- Step 8 - Replace the 5 μm paper with the 1 μm paper. Polish the terminus with very light pressure using a figure-8 motion for 10 to 20 complete motions.
- Step 9 - Replace the 1 μm paper with the 0.1 μm paper. Polish the terminus with very light pressure using a figure 8 motion for 10 to 20 complete motions.
- Step 10 - Rotate the top of the polishing tool counterclockwise (90 degrees) and separate the top from the base. Insert the terminus removal tool into the bottom of the terminus cavity of the polishing tool top and press on the hilt of the removal tool until the tool clicks into place (see figure 7A1-10). Depress the plunger and slide the terminus out of the polishing tool. Clean the terminus and the polishing tool with a wipe dampened with alcohol and blow them dry with air.

FIGURE 7A1-10. Removing the terminus from the polishing tool.

- Step 11 - Repeat steps 1 through 10 for all of the termini.

3.2.5.2 Domed end polish.

3.2.5.2.1 Standard procedure. This procedure will produce a terminus with a domed end polish. This procedure is typically used for single mode applications with a minimum return loss requirement of 30 db. Procedures for hand polishing are contained herein. Machine polishing may be used as an alternate method, provided the following requirements are satisfied:

- a. The manufacturer's instructions will be rigidly adhered to, except that the polishing papers or disks shall be 5 μm aluminum oxide foam backed, 1 μm aluminum oxide mylar backed, and 0.1 μm diamond mylar backed as used in hand polishing. (NOTE: Alternate polishing materials may be used if authorized approval is obtained and the polishing machine includes the appropriate stops to prevent changes to the ferrule length.)
- b. The machine polished terminus shall undergo the same quality check used for the manually polished terminus as described herein.

NOTE: The procedures contained herein should produce an optical terminus with a physical contact (PC) polish.

Step 1 - WARNING: Wear safety glasses when scoring the fiber to avoid possible eye injury.

Remove the terminus from the cure adapter and score the fiber close to the terminus tip at the epoxy interface using one short light stroke with cleaving tool (see figure 7A1-11). (NOTE: Do not break the fibers with the cleaving tool.) Pull off each fiber with a gentle, straight pull. Deposit the waste fiber in a trash container.

FIGURE 7A1-11. Scoring the fiber.

NOTE: The termini not being polished should be left in the cure adapters during the polishing process to protect the fibers from breakage.

NOTE: Before inserting the terminus into the polishing tool, the terminus may be held vertically and the end of the fiber polished off by lightly running the 5 μm polishing paper over the top of the terminus tip. (This is referred to as air polishing the terminus.)

Step 2 - Rotate the top half of the polishing tool 90 degrees counterclockwise and separate the top from the base.

FIGURE 7A1-12. Placing the terminus in the insertion tool.

- Step 3 - Place the end of the terminus insertion tool at the rear of the crimp sleeve with the OFCC laid in the tool channel (see figure 7A1-12).
- Step 4 - Insert the terminus into the center of the polishing tool top. Apply pressure with the insertion tool until the terminus snaps into place. Remove the tool by pulling straight back (see figure 7A1-13). (NOTE: Difficulty in inserting the terminus into the polishing tool may indicate epoxy on outside of the terminus which must be removed before proceeding.)
- Step 5 - Install the top half of the polishing tool on the bottom half and rotate it clockwise (90 degrees) until it locks in place.

FIGURE 7A1-13. Inserting the terminus in the polishing tool.

- Step 6 - Clean the glass polishing plate, the resilient pad, the backs of the polishing papers, and the surface of the polishing tool using a wipe dampened with alcohol. Blow all of the surfaces dry with air.
- Step 7 - Place the 5 μm polishing paper on the glass plate and start polishing the terminus with very light pressure (the weight of the tool) using a figure-8 motion. Do not overpolish the terminus. (NOTE: The first polish is complete when all of the epoxy is gone from the tip of the terminus.) Since the polishing time varies with the amount of epoxy present on the tip of the terminus, inspect the terminus tip frequently. Whenever the polishing tool is lifted, remove the grit from the tool and the terminus with air. When polishing is complete, clean the terminus and the polishing tool using a wipe dampened with alcohol and blow them dry with air. Perform a rough inspection of the ferrule end using the eye loop.
- Step 8 - Place the resilient pad on top of the glass plate. Place 1 μm paper on the resilient pad. Wet the paper and polish the terminus with no pressure using a figure-8 motion for 10 complete motions.
- NOTE: The polish tool should hydroplane above the paper surface during this polish.
- Step 9 - Replace the 1 μm paper with the 0.1 μm paper. Wet the paper and polish the terminus with no pressure using a figure-8 motion for 20 to 30 complete motions.
- NOTE: The polish tool should hydroplane above the paper surface during this polish.
- Step 10 - Rotate the top of the polishing tool counterclockwise (90 degrees) and separate the top from the base. Insert the terminus removal tool into the bottom of the terminus cavity of the polishing tool top and press on the hilt of the removal tool until the tool clicks into place (see figure 7A1-14). Depress the plunger and slide the terminus out of the polishing tool. Clean the terminus and the polishing tool with a wipe dampened with alcohol and blow them dry with air.

FIGURE 7A1-14. Removing the terminus in the polishing tool.

Step 11 - Repeat steps 1 through 10 for all of the termini.

3.2.6 Quality check.

Step 1 - Examine the terminus with the optical microscope to ensure that the optical surface is smooth and free of scratches, pits, chips, and fractures. If any defects are present, repeat steps 2 through 6, 8, and 9 or reterminate the fiber (see figure 7A1-15). (NOTE: Overpolishing the fiber will increase the optical loss of the terminus. Do not polish the terminus more than necessary to pass the quality check.) A high intensity back light may be used to illuminate the fiber during the quality check.

FIGURE 7A1-15. Quality check.

3.2.7 Installation of the terminus into the Hermaphroditic jam nut mounted receptacle.

- Step 1 - Place the end of the terminus insertion tool at the rear of terminus in the tool channel (see figure 7A1-16).
- Step 2 - Place the terminus in the proper cavity in the rear of the hermaphroditic receptacle. Apply pressure with the insertion tool until the terminus snaps into place (see figure 7A1-17). Remove the tool by pulling straight back. (NOTE: A properly inserted terminus will have some axial "play" within the insert cavity.)

FIGURE 7A1-16. Installing the terminus in the connector.

Step 3 - Repeat steps 1 and 2 for all of the termini.

Step 4 - Install the dust cover over the front of the hermaphroditic receptacle.

3.2.8 Removal of the termini from the connector insert.

NOTE: Perform this procedure only if the termini are to be removed from the connector.

NOTE: Proceed to step 1 below for socket termini. Proceed to step 2 below for pin termini.

Step 1 - **CAUTION:** Do not rotate the tool while the sleeve is in the insert.

Remove the detachable socket insert from the hermaphroditic receptacle.

Step 2 - Insert the terminus removal tool into the terminus cavity from the front of the insert and press on the hilt of the tool until it snaps into place (see figure 7A1-18). Depress the plunger to slide the terminus out the rear of the insert.

FIGURE 7A1-17. Position for installing terminus in the connector.

FIGURE 7A1-18. Removing the terminus from the connector insert.

3.3 Procedure II. Method 7A1-2 Installation of termini in hermaphroditic cable plugs onto shipboard cable. Method 7A1-cover the termination procedure for placing a hermaphroditic cable plug on the end of a fiber optic cable.

3.3.1 Equipment and materials. The equipment and materials in table 7A1-III shall be used to perform this procedure:

TABLE 7A1-III. Equipment and materials.

Description	Quantity
Wipes (NAVSEA DWG 6872813-22 or equal)	As required
Ruler	1
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required
Cable jacket stripping tool (NAVSEA DWG 6872813-8 or equal)	1
Masking tape	As required
Kevlar shears (NAVSEA DWG 6872813-16 or equal)	1
OFCC strip tool (NAVSEA DWG 6872813-10 or equal)	1
Safety glasses	1
Buffer strip tool (NAVSEA DWG 6872813-9 or equal)	1
Cleaning wire (NAVSEA DWG 6872813-32 or equal)	As required
Epoxy (MIL-A-24792)	As required
Syringe with dispensing needles (NAVSEA DWG 6872813-27 or equal)	As required
Crimp tool (NAVSEA DWG 6872813-17 or equal)	1
Razor blade	1
Cure adapters (NAVSEA DWG 6872813-19 or equal)	As required
Curing oven (NAVSEA DWG 6872813-19 or equal)	1
Cable stand (NAVSEA DWG 6872813-19 or equal)	1
Cable stand ring (NAVSEA DWG 6872813-19 or equal)	1
Cable clip (NAVSEA DWG 6872813-19 or equal)	1
Cleaver (NAVSEA DWG 6872813-7 or equal)	1
Polishing paper (5 μ m aluminum oxide, foam backed) (NAVSEA DWG 6872813-24 or equal)	As required
Polishing tool ceramic termini (NAVSEA DWG 6872813-18 or equal)	1
Terminus insertion tool (NAVSEA DWG 6872813-2 or equal)	1
Terminus insertion tool 90 ^o (NAVSEA DWG 6872813-15 or equal)	1
Glass polishing plate (NAVSEA DWG 6872813-3 or equal)	1
7X eye loupe	1
Polishing paper (1 μ m aluminum oxide, mylar backed) (NAVSEA DWG 6872813-23 or equal)	As required
Water bottle (sealable type)	1
Terminus removal tool (NAVSEA DWG 6872813-6 or equal)	1
Optical microscope 400X (NAVSEA DWG 6872813-28 or equal)	1
Alignment sleeve insertion and removal tool (ceramic termini)(NAVSEA DWG 6872813-4 or equal)	1
Polishing paper (0.1 μ m diamond, mylar backed) (NAVSEA DWG 6872813-41 or equal)	As required
Resilient pad (70 to 90 durometer) (NAVSEA DWG 6872813-42 or equal)	1
5/64 inch Allen Wrench	1
0.050 inch Allen wrench socket (3/8 inch drive)	1
3/4 inch crow foot wrench (3/8 inch drive or a 1/4 inch drive with 1/4 to 3/8 inch adapter)	1
1-3/8 inch wrench (open end)	1
3/4 inch wrench (open end)	1
"O"-ring insertion tool (NAVSEA DWG 7325763-1H-6009AU or equal)	1
Music wire	As required
Adjustable wrench	1
Protective caps (plastic)	As required

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

NOTE: Verify that the epoxy shelf life has not expired. Do not use epoxy with an expiration date that has passed.

3.3.2 Cable preparation.

Step 1 - Ensure the cable is the correct type as specified in NAVSEA drawing 7325759 and has a length of 152.4 m (500 ft).

Step 2 - Clean the outer cable jacket that will be in contact with the connector with a wipe dampened with alcohol and blow it dry with air.

NOTE: Keep the cable and connector parts free from oil, dirt and grease throughout the installation procedure. If cleaning is necessary, use a wipe dampened with alcohol and blow the part dry with air.

Step 3 - Cut the cable ends so that the first (outer) and second (inner) layers of the outer cable jacket are flush with the breakout cables.

Step 4 - Place the cable grip on each end of the cable. Position the cable grip so that the end with the cable loop faces the cable end.

NOTE: Compress cable grip and slide along cable so that each cable grip is at least 1 m (3 ft) from the cable end. Loop in cable grip is pointed toward end of cable.

3.3.3 Strain relief preparation.

Step 1 - Slide the connector parts onto the cable in the order indicated below (see figure 7A1-19).

- a. Flex fitting
- b. Retaining nut
- c. Conical nut washer

NOTE: Side of washer with the larger diameter contact surface (concave surface) is placed on cable first.

- d. Compression nut

FIGURE 7A1-19. Cable plug components to slide onto cable.

Step 2 - Mark the cable jacket approximately 165 mm (6.5 inches) from the end and strip back the first layer of the outer cable jacket to the mark using the cable stripper. Fold back the arimid yarn strength members.

- Step 3 - **CAUTION:** Do not cut or nick the individual breakout cable jackets.

Strip back the second layer of the outer cable jacket using the cable stripper. Strip back to the same length as the first layer of the outer jacket. Fold back the arimid yarn strength members and temporary tape them to the first layer of the outer cable jacket.

- Step 4 - Cut off any fillers using the kevlar (arimid yarn) shears.

NOTE: Cable construction is 9 around 3. Three of the single fiber cables may be wrapped around tape and mistaken as a central strength member.

- Step 5 - Remove any water blocking material, clean the single fiber cable's using a wipe dampened with alcohol and blow them dry with air.

3.3.4 Securing the strain relief.

- Step 1 - Remove the tape from the arimid yarn strength members and fold forward.

- Step 2 - Slide the compression ring to the end of the outer cable jacket (see figure 7A1-20).

NOTE: The grooved side of the compression ring should face the compression nut.

- Step 3 - Fold the arimid yarn strength members back over the compression ring and the cable in the direction of the compression nut.

FIGURE 7A1-20. Strain relief assembly.

- Step 4 - Place the o-ring on the o-ring insertion tool by forcing the o-ring up the cone to the larger end of the tool (see figure 7A1-21).

NOTE: Do not apply lubricant to the o-ring.

FIGURE 7A1-21. Installing the O-ring.

- Step 5 - Slide the o-ring tool up the breakout cables (larger end first), then over the compression ring covered with the arimid yarn strength members.
- Step 6 - Force the o-ring over the compression ring onto the arimid yarn (see figure 7A1-21).
- NOTE: Arimid yarn is to be evenly distributed around the compression ring and ALL STRANDS to be tight against the outside diameter of the compression ring.
- Step 7 - Remove the o-ring tool.
- Step 8 - Fold the arimid yarn strength members forward over the O-ring and the compression ring.
- NOTE: Tape the arimid yarn strength members to the breakout cables to ease the installation of the strain relief housing.
- Step 9 - Slide the strain relief housing up the cable to the compression ring. Gently feed the breakout cables and arimid yarn strength members through the strain relief housing.
- Step 10 - Slide the compression nut up to the strain relief housing. Thread the strain relief nut into the strain relief housing. Tighten the parts by hand.
- Step 11 - Place a (3/4 inch) crows foot wrench with a torque wrench on the compression nut and a ?? cm (?? inch) wrench on the strain relief housing.
- Step 12 - Apply a 5.65 N m (50 in-lb) torque on the compression nut. Remove the tools once tightened.
- NOTE: Use care to not nick or scratch the connector coating during assembly.
- Step 13 - Remove the tape and trim the arimid yarn strength members, using kevlar shears, approximately 2.5 cm (1 inch) beyond the face of the strain relief nut.

3.3.5 Fiber preparation.

- Step 1 - Identify and mark one end of the cable as cable end "A" and the other as cable end "B".
- NOTE: This marking is used for termini placement on the single fiber cables in conjunction with table 7A1-IV.

TABLE 7A1-IV. Termini type to be placed on each single fiber cable.

Cable End A Termini Type	Cable End A Connector Pin- Out	Cable Identification		Cable End B Connector Pin-Out	Cable End B Termini Type
MM Socket	1J	1 = MM1	Blue	1P	MM Pin
MM Socket	2J	2 = MM2	Orange	2P	MM Pin
MM Socket	3J	3 = MM3	Green	3P	MM Pin
MM Socket	4J	4 = MM4	Brown	4P	MM Pin
MM Pin	1P	5 = MM5	Slate (Gray)	1J	MM Socket
MM Pin	2P	6 = MM6	White	2J	MM Socket
MM Pin	3P	7 = MM7	Red	3J	MM Socket
MM Pin	4P	8 = MM8	Black	4J	MM Socket
SM Socket	5J	9 = SM1	Yellow	5P	SM Pin
SM Socket	6J	10 = SM2	Violet (Purple)	6P	SM Pin
SM Pin	5P	11 = SM3	Rose	5J	SM Socket
SM Pin	6P	12 = SM4	Aqua	6J	SM Socket

- Step 2 - Trim the breakout cables designated for socket termini to the A dimension specified in table 7A1-V using the kevlar shears (see figure 7A1-22).
- NOTE: No crimp sleeve is used in this cable plug termination.

FIGURE 7A1-22. Cable stripping dimensions.

- Step 3 - Trim the single fiber cables designated for pin termini to the A dimension specified in table 7A1-V using the kevlar shears (see figure 7A1-22).
- Step 4 - Remove the single fiber cable jackets back to dimension A in table 7A1-V using the OFCC (breakout cable) stripper.
- Step 5 - Mark the buffered fiber with the color code or single fiber cable number.
- NOTE: One method is to use a portion of the single fiber cable that contains the color or single fiber cable number as a sleeve and place it on each buffered fiber.
- Step 6 - Trim the single fiber cable arimid yarn so that it does not extend past the single fiber cable jacket.

TABLE 7A1-V. Cable stripping dimensions.

Termini Configuration	Dimensions		
	mm (in)		
	A	B	C
Socket	140 (5.5)	114 (4.5)	13 (0.5)
Pin	140 (5.5)	114 (4.5)	19 (0.75)

- Step 7 - **WARNING:** Wear safety glasses when removing the fiber buffer and coating to avoid possible eye injury.
- Remove the fiber buffers and coatings back to dimension C in table 7A1-V using the buffer stripper. Remove the buffer and coating in small sections (approximately 6 mm (0.25 in) at a time.)
- NOTE: Normally, the buffer and coating are tightly adhered to one another and come off of the fiber at the same time.
- Step 8 - **CAUTION:** The uncoated fiber is in its most vulnerable state. Take extreme care not to damage the fiber. Breakage of any one fiber from this point until the connector is completely assembled will require repetition of this and the following steps in order to maintain approximately equal length of all the fibers in the cable.

Remove any residual coating material from the bare fibers with a wipe dampened with alcohol. Wipe only once from the end of the buffer towards the end of the fiber. (NOTE: Do not repeatedly wipe the bare fiber as this will weaken the fiber.)

3.3.6 Installation of the termini onto the fibers.

NOTE: This procedure describes the process for installing ceramic termini onto either multimode or single-mode fibers. The termini use epoxy to secure the fiber.

Step 1 - Turn on the curing oven so that it attains the proper temperature before the termini are placed within it (approximately 20 minutes).

Step 2 - Inspect the terminus and verify that the ferrule hole is free and clean of dirt. This can be accomplished by holding the front of the terminus up to a light and verifying that the light is visible from the rear of the terminus. If light cannot be seen through the terminus, push music wire through the terminus hole to clear it. Then blow dry air through the hole to remove any debris.

Step 3 - Remove the divider from a 2-part epoxy package and mix the two parts together until the epoxy is a smooth uniform color (see figure 7A1-23). The epoxy can be mixed by either repeatedly rolling the divider over the package or gently sliding the divider over the package.

NOTE: Alternatively, the epoxy may be mixed by massaging the epoxy package by hand.

CAUTION: Do not introduce large air bubbles into the epoxy during the mixing process. Large air bubbles in the epoxy can lead to connector failure during temperature extremes.

FIGURE 7A1-23. Mixing the epoxy.

Step 4 - Install the syringe tip on the syringe, remove the plunger, and squeeze the epoxy into the syringe. Replace the plunger.

Step 5 - WARNING: Wear safety glasses while dispensing the epoxy to avoid possible eye injury.

Remove air pockets in the syringe by holding the tip of the syringe upward and dispensing epoxy onto a wipe until it runs free and clear.

Step 6 - Slide the terminus, rear first, onto the syringe tip (see figure 7A1-24). Keeping the syringe vertical, depress the plunger and slowly inject epoxy into the terminus until it escapes out of the ferrule, forming a very small bead. (NOTE: Do not overfill. Be extremely careful not to get epoxy on the pin spring or other terminus moving parts.)

FIGURE 7A1-24. Injecting epoxy into the terminus.

Step 7 - Withdraw the syringe from the terminus. Maintain some pressure on the plunger as the syringe is withdrawn so that the terminus is completely filled with epoxy. Using a wipe dampened with alcohol, wipe away any epoxy on the outer diameter of ferrule without disturbing the epoxy bead.

NOTE: Alternatively, the terminus may be completely filled by maintaining a light pressure on the syringe plunger and allowing the epoxy to push the terminus off of the syringe tip.

Step 8 - Insert the fiber into the rear of the terminus (see figure 7A1-25). Gently work the fiber through the terminus until the buffer seats against the rear of the ferrule. The buffered fiber should come up to the rear of the terminus. Once inserted, do not allow the fiber to slip back.

NOTE: Rotate the fiber as it moves through the connector ferrule. This evenly distributes epoxy around the fiber in the terminus hole.

FIGURE 7A1-25. Inserting the fiber into the terminus.

Step 9 - Verify that there is a small amount of epoxy around the fiber where it protrudes from the ferrule. If it is found that there is no small bead of epoxy on the terminus tip, carefully add a small amount of epoxy around the fiber. (NOTE: There should only be a small amount of epoxy around the fiber to support it later during the polishing process. If too much epoxy is around the fiber during the curing process it may cause the fiber to crack.)

Step 10 - Using a wipe dampened with alcohol, carefully wipe away any excess epoxy on the fiber that is more than 2 mm (0.08 in) from the ferrule tip surface.

FIGURE 7A1-26. Inserting a terminus in a cure adapter.

Step 11 - Insert the terminus into the cure adapter until it snaps into place (see figure 7A1-26).

Step 12 - Repeat steps 2 through 13 for each fiber to be terminated.

Step 13 - Place the cure adapters in the curing oven, and position the cable vertically over the oven using the cable stand, cable stand ring and cable clip (see figure 7A1-27). Cure the epoxy for a minimum of 10 minutes (maximum of 30 minutes) at 120⁰ C (248⁰ F). (NOTE: When the cable is positioned above the terminus, make sure that no bends are placed in the buffered fibers. Each buffered fiber should enter the terminus parallel to the terminus.)

FIGURE 7A1-27. Termini in the curing oven.

Step 14 - Turn the curing oven off and remove the cure adapters and termini from the curing oven. Allow the cure adapters and termini to cool for approximately 4 minutes.

3.3.7 Polishing the fiber ends.

NOTE: Use the flat end polish for termini on multimode fiber and a domed end polish for termini on single mode fiber.

3.3.7.1 Flat end polish. This procedure will produce a terminus with a flat end polish. This procedure is typically used for multimode applications. Procedures for hand polishing are contained herein. Machine polishing may be used as an alternate method, provided the following requirements are satisfied:

- a. The manufacturer's instructions will be rigidly adhered to, except that the polishing papers or disks shall be 5 μ m aluminum oxide foam backed, 1 μ m aluminum oxide mylar backed, and 0.1 μ m diamond mylar backed as used in hand polishing. (NOTE: Alternate polishing materials may be used if authorized approval is obtained and the polishing machine includes the appropriate stops to prevent changes to the ferrule length.)
- b. The machine polished terminus shall undergo the same quality check used for the manually polished terminus as described herein.

NOTE: The procedures contained herein should produce an optical terminus with a physical contact (PC) polish.

Step 1 - WARNING: Wear safety glasses when scoring the fiber to avoid possible eye injury.

Remove the terminus from the cure adapter and score the fiber close to the terminus tip at the epoxy interface using one short light stroke with cleaving tool (see figure 7A1-28). (NOTE: Do not break the fibers with the cleaving tool.) Pull off each fiber with a gentle, straight pull. Deposit the waste fiber in a trash container.

FIGURE 7A1-28. Scoring the fiber.

NOTE: The termini not being polished should be left in the cure adapters during the polishing process to protect the fibers from breakage.

NOTE: Before inserting the terminus into the polishing tool, the terminus may be held vertically and the end of the fiber polished off by lightly running the 5 μ m polishing paper over the top of the terminus tip. (This is referred to as air polishing the terminus.)

Step 2 - Rotate the top half of the polishing tool 90 degrees counterclockwise and separate the top from the base.

Step 3 - Place the end of the terminus insertion tool at the rear of the crimp sleeve with the OFCC laid in the tool channel (see figure 7A1-29).

FIGURE 7A1-29. Placing the terminus in the insertion tool.

Step 4 - Insert the terminus into the center of the polishing tool top. Apply pressure with the insertion tool until the terminus snaps into place. Remove the tool by pulling straight back (see figure 7A1-30). (NOTE: Difficulty in inserting the terminus into the polishing tool may indicate epoxy on outside of the terminus which must be removed before proceeding.)

FIGURE 7A1-30. Insertion the terminus in the polishing tool.

- Step 5 - Install the top half of the polishing tool on the bottom half and rotate it clockwise (90 degrees) until it locks in place.
- Step 6 - Clean the glass polishing plate, the backs of the polishing papers, and the surface of the polishing tool using a wipe dampened with alcohol. Blow all of the surfaces dry with air.
- Step 7 - Place the 5 μm polishing paper on the glass plate and start polishing the terminus with very light pressure (the weight of the tool) using a figure-8 motion. Do not overpolish the terminus. (NOTE: The first polish is complete when all of the epoxy is gone from the tip of the terminus.) Since the polishing time varies with the amount of epoxy present on the tip of the terminus, inspect the terminus tip frequently. Whenever the polishing tool is lifted, remove the grit from the tool and the terminus with air. When polishing is complete, clean the terminus and the polishing tool using a wipe dampened with alcohol and blow them dry with air. Perform a rough inspection of the ferrule end using the eye loop.
- Step 8 - Replace the 5 μm paper with the 1 μm paper. Polish the terminus with very light pressure using a figure-8 motion for 10 to 20 complete motions.
- Step 9 - Replace the 1 μm paper with the 0.1 μm paper. Polish the terminus with very light pressure using a figure-8 motion for 10 to 20 complete motions.
- Step 10 - Rotate the top of the polishing tool counterclockwise (90 degrees) and separate the top from the base. Insert the terminus removal tool into the bottom of the terminus cavity of the polishing tool top and press on the hilt of the removal tool until the tool clicks into place (see figure 7A1-31). Depress the plunger and slide the terminus out of the polishing tool. Clean the terminus and the polishing tool with a wipe dampened with alcohol and blow them dry with air.

FIGURE 7A1-31. Removing the terminus from the polishing tool.

- Step 11 - Repeat steps 1 through 10 for all of the termini.

3.3.7.2 Domed end polish.

3.3.7.2.1 Standard procedure. This procedure will produce a terminus with a domed end polish. This procedure is typically used for single mode applications with a minimum return loss requirement of 30 db. Procedures for hand polishing are contained herein. Machine polishing may be used as an alternate method, provided the following requirements are satisfied:

- The manufacturer's instructions will be rigidly adhered to, except that the polishing papers or disks shall be 5 μm aluminum oxide foam backed, 1 μm aluminum oxide mylar backed, and 0.1 μm diamond mylar backed as used in hand polishing. (NOTE: Alternate polishing materials may be used if authorized approval is obtained and the polishing machine includes the appropriate stops to prevent changes to the ferrule length.)
- The machine polished terminus shall undergo the same quality check used for the manually polished terminus as described herein.

NOTE: The procedures contained herein should produce an optical terminus with a physical contact (PC) polish.

Step 1 - **WARNING:** Wear safety glasses when scoring the fiber to avoid possible eye injury.

Remove the terminus from the cure adapter and score the fiber close to the terminus tip at the epoxy interface using one short light stroke with cleaving tool (see figure 7A1-32). (NOTE: Do not break the fibers with the cleaving tool.) Pull off each fiber with a gentle, straight pull. Deposit the waste fiber in a trash container.

FIGURE 7A1-32. Scoring the fiber.

NOTE: The termini not being polished should be left in the cure adapters during the polishing process to protect the fibers from breakage.

NOTE: Before inserting the terminus into the polishing tool, the terminus may be held vertically and the end of the fiber polished off by lightly running the 5 μ m polishing paper over the top of the terminus tip. (This is referred to as air polishing the terminus.)

Step 2 - Rotate the top half of the polishing tool 90 degrees counterclockwise and separate the top from the base.

Step 3 - Place the end of the terminus insertion tool at the rear of the crimp sleeve with the OFCC laid in the tool channel (see figure 7A1-33).

FIGURE 7A1-33. Placing the terminus in the insertion tool.

Step 4 - Insert the terminus into the center of the polishing tool top. Apply pressure with the insertion tool until the terminus snaps into place. Remove the tool by pulling straight back (see figure 7A1-34). (NOTE: Difficulty in inserting the terminus into the polishing tool may indicate epoxy on outside of the terminus which must be removed before proceeding.)

FIGURE 7A1-34. Inserting the terminus in the polishing tool.

- Step 5 - Install the top half of the polishing tool on the bottom half and rotate it clockwise (90 degrees) until it locks in place.
- Step 6 - Clean the glass polishing plate, the resilient pad, the backs of the polishing papers, and the surface of the polishing tool using a wipe dampened with alcohol. Blow all of the surfaces dry with air.
- Step 7 - Place the 5 μm polishing paper on the glass plate and start polishing the terminus with very light pressure (the weight of the tool) using a figure-8 motion. Do not overpolish the terminus. (NOTE: The first polish is complete when all of the epoxy is gone from the tip of the terminus.) Since the polishing time varies with the amount of epoxy present on the tip of the terminus, inspect the terminus tip frequently. Whenever the polishing tool is lifted, remove the grit from the tool and the terminus with air. When polishing is complete, clean the terminus and the polishing tool using a wipe dampened with alcohol and blow them dry with air. Perform a rough inspection of the ferrule end using the eye loop.
- Step 8 - Place the resilient pad on top of the glass plate. Place 1 μm paper on the resilient pad. Wet the paper and polish the terminus with no pressure using a figure-8 motion for 10 complete motions.
- NOTE: The polish tool should hydroplane above the paper surface during this polish.
- Step 9 - Replace the 1 μm paper with the 0.1 μm paper. Wet the paper and polish the terminus with no pressure using a figure-8 motion for 20 to 30 complete motions.
- NOTE: The polish tool should hydroplane above the paper surface during this polish.
- Step 10 - Rotate the top of the polishing tool counterclockwise (90 degrees) and separate the top from the base. Insert the terminus removal tool into the bottom of the terminus cavity of the polishing tool top and press on the hilt of the removal tool until the tool clicks into place (see figure 7A1-35). Depress the plunger and slide the terminus out of the polishing tool. Clean the terminus and the polishing tool with a wipe dampened with alcohol and blow them dry with air.

FIGURE 7A1-35. Removing the terminus from the polishing tool.

Step 11 - Repeat steps 1 through 10 for all of the termini.

3.3.8 Quality check.

Step 1 - Examine the terminus with the optical microscope to ensure that the optical surface is smooth and free of scratches, pits, chips, and fractures. If any defects are present, repeat steps 2 through 6, 8, and 9 or reterminate the fiber (see figure 7A1-36). (NOTE: Overpolishing the fiber will increase the optical loss of the terminus. Do not polish the terminus more than necessary to pass the quality check.) A high intensity back light may be used to illuminate the fiber during the quality check.

FIGURE 7A1-36. Quality check.

3.3.9 Installation of the terminus into the connector insert.

- Step 1 - Fit the spacing shafts of the insert into the notches in the face of the strain relief housing until they snap into place (see figure 7A1-38).
- Step 2 - Place the end of the terminus insertion tool at the rear of terminus in the tool channel (see figure 7A1-37).
- Step 3 - Place the terminus in the proper cavity in the rear of the plug insert. Apply pressure with the insertion tool until the terminus snaps into place (see figure 7A1-38). Remove the tool by pulling straight back. (NOTE: A properly inserted terminus will have some axial "play" within the insert cavity.)

FIGURE 7A1-37. Installing the terminus using insertion tool.

FIGURE 7A1-38. Installing the terminus in the plug insert.

Step 4 - Repeat steps 2 and 3 for all of the termini.

3.3.10 Final assembly of cable plug.

NOTE: Take care to not pinch or twist the buffered fibers during this procedure.

NOTE: Ensure that the detachable socket insert is fastened to the plug insert prior to plug insert placement into the plug housing. O-ring damage will result if the detachable socket insert is not fastened to the plug insert prior to placement into the plug housing. Use a 5/64 inch Allen wrench to fasten the detachable socket insert to the plug insert.

FIGURE 7A1-39. Cable plug final assembly.

Step 1 - Slide the strain relief/cable assembly partially into the plug housing (see figure 7A1-39).

Step 2 - Rotate the plug housing until the slot in the strain relief housing aligns with the detent inside the plug housing.

Step 3 - Once aligned, fully seat the strain relief housing by sliding it the rest of the way into the plug housing.

Step 4 - Slide the retaining nut up to the plug housing and thread the retaining nut onto the plug housing until hand tight.

Step 5 - Place the coupling ring in the back position and engage the locking mechanism.

NOTE: Coupling ring has a keyed position that prevents rotation with the plug housing. Place the coupling ring in the back position to activate the rotation prevention key prior to applying the torque.

Step 6 - Place a 3.5 cm (1-3/8 inch) wrench on the retaining nut flats and a combination torque wrench/strap wrench around the coupling ring.

Step 7 - Apply a $16 \pm \text{N m}$ ($140 \pm \text{In-lb}$) torque on the coupling ring. Remove tools once tightened.

NOTE: Use care to not nick or scratch the connector coating during assembly.

Step 8 - Slide the flex fitting up to the retaining nut and thread the flex fitting into the retaining nut until hand tight.

Step 9 - Place a 3.5 cm (1-3/8 inch) wrench on the flex fitting and a combination torque wrench/strap wrench around the retaining nut.

Step 10 - Apply a $4 \pm \text{N m}$ ($35 \pm 5 \text{ in-lb}$) torque on the flex fitting. Remove the tools once tightened.

NOTE: Use care to not nick or scratch the connector coating during assembly.

Step 11 - Place a 0.050 inch Allen wrench on one of the two 4-40 set screws located on the flex fitting flange (see figure 7A1-39) and torque until secure.

NOTE: Do not tighten set screw to the point where flex fitting deforms.

Step 12 - Place a 0.050 inch Allen wrench on the other 4-40 set screws located 180 degrees from the first one on the flex fitting flange (see figure 7A1-39) and torque until secure.

NOTE: Do not tighten set screw to the point where flex fitting deforms.

Step 13 - Install the cable plug dust cover over the front of the connector.

3.3.11 Removal of the termini from the connector insert.

NOTE: Perform this procedure only if the termini are to be removed from the connector.

NOTE: Proceed to step 1 below for socket termini. Proceed to step 2 below for pin termini.

Step 1 - **CAUTION:** Do not rotate the tool while the sleeve is in the insert.

Remove the detachable socket insert from the plug insert.

Step 2 - Insert the terminus removal tool into the terminus cavity from the front of the insert and press on the hilt of the tool until it snaps into place (see figure 7A1-40). Depress the plunger to slide the terminus out the rear of the insert.

FIGURE 7A1-40. Removing the terminus from the insert.

METHOD 7B1

SHIPBOARD INTERCONNECTION BOX INTERIOR CABLE ROUTING

1. SCOPE.

1.1 Scope. This method describes procedures for shipboard, fiber optic cable routing interior to and between the interconnection boxes. Method 7B1-1 covers the hermaphroditic receptacle installation into port/starboard or a midship/sail interconnection box. Method 7B1-2 covers interconnection box interior cable routing to a patch panel for ST connector termination on fiber optic cable. Method 7B1-3 covers interconnection box interior cable routing to the pin and socket termini used for CID A-A-XX159 hermaphroditic connectors on fiber optic cable.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

- a. Do not stare into the end of a fiber until verifying that the fiber is not connected to a laser light source or LED.

3.2. Procedure I. Method 7B-1 Interconnection box hermaphroditic receptacle installation.

3.2.1 The interconnection box and the equipment in table 7B1-I shall be used to perform this installation.

TABLE 7B1-I. Equipment and materials.

Description	Quantity
D hole punch (NAVSEA DWG 7325763-1H-6009AH or equal)	1
Interconnection box (NAVSEA DWG 7325762-1A-0346 or equal)	1
Dust cover, hermaphroditic connector, with interior threads (NAVSEA DWG 7325761-1A-6004AD or equal)	1
Connector, receptacle, hermaphroditic compatible (NAVSEA DWG 7325762-1A-6004AC-6000AC or equal)	1
ST-to-ST adapter, single mode, nickel plated brass or stainless steel housing (NAVSEA DWG 7325761-1A-6007AB or equal)	36
Wrench, 1-7/8 inch, open end	1
Wrench, 2 inch, open end	1

3.2.2 Interconnection box installation. This installation includes orientating and punching the D hole, then inserting the hermaphroditic receptacle.

Step 1 - Use D hole punch to place the correctly oriented "D hole(s)" in the top/bottom panel of the interconnection box.

Step 2 - Install the interconnection box onto the mounting surface

- a. Place one "D" hole in the interconnection box for installation "A" configuration in the orientation shown in figure 7B1-1.

FIGURE 7B1-1. Installation "A" Kit D hole orientation.

- a. Place two "D" holes in the interconnection box for installation "B" configuration in the orientation shown in figure 7B1-2.

FIGURE 7B1-2. Installation "B" Kit D hole orientation and markings.

Step 3 - Remove the large nut on the hermaphroditic receptacle

Step 4 - Place the hermaphroditic receptacle inside the interconnection box and through the D hole.

Step 5 - Place ring from dust cover onto the hermaphroditic receptacle.

Step 6 - Place and tighten the nut onto the hermaphroditic receptacle.

NOTE: Use a 1-7/8 inch wrench to tighten the nut. Use a 2 inch wrench inside the interconnection box to hold the hermaphroditic connector while tightening the nut.

Step 7 Mark interconnection boxes for the installation "B" Kit configuration as shown in figure 7B1-2.

3.3 Procedure II. Method 7B1-2 Interconnection box cable routing to a patch panel (see figure 7B1-3). Method 7B1-1 describes the entry of shipboard cable into the interconnection box, routing of the single fiber cables (OFCCs) around the interconnection box and termination of the single fiber cables at a patch panel, such as in the ship's radio room.

3.3.1 Equipment and materials. The equipment and materials in tables 2B1-I and 2C1-I shall be used to perform this procedure.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

FIGURE 7B1-3. Single fiber cable routing inside interconnection box.

3.3.2 Cable preparation.

Step 1 - Install each cable into the interconnection box multiple cable penetrator (MCP) per Method 2B1.

Step 2 - Perform cable entry, OFCC routing, and OFCC termination to the patch panel in accordance with Method 2B1 and Method 2C1 of this standard.

NOTE: The cable outer jacket should have been stripped back 0.9 m (3 ft) and each OFCC terminated with an ST connector in accordance with Method 5B1 of this standard.

NOTE: Eight fiber, multimode cable is marked M85045/17-01P. Eight fiber, single Mode cable is marked M85045/17-02P.

Step 3 - Route the 0.9 m (3 ft) of stripped back OFCC's around the interconnection box per Method 2C1 of this standard. All OFCC's shall be routed around the interconnection box at least three quarters of a turn.

NOTE: Routing one-half of a turn around the interconnection box then to the termination point is the minimum acceptable routing distance.

Step 4 - Install the ST connector on the end of each OFCC into the patch panel per 3.2.2 of Method 2C1.

3.4 Procedure III. Method 7B1-3 Interconnection box cable routing to a hermaphroditic receptacle. Method 7B1-2 describes the routing of shipboard cable around the interconnection box for termination at a hermaphroditic receptacle without going through an intermediary patch panel inside the interconnection box.

TABLE 7B1-II. Equipment and materials.

Description	Quantity
Termini insertion tool, straight, M29504 (NAVSEA DWG 7325763 [item 6009 BF] or equal)	1
Termini removal tool, M29504 (NAVSEA DWG 7325763 [item 6009 BF] or equal)	1

3.4.1 Equipment and materials. The equipment and materials in tables 2B1-II, 2C1-I, and 7B1-2 shall be used to perform this procedure.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.4.2 Cable preparation.

NOTE: Exposed portion of single mode, single fiber cable at the end of a multiple fiber cable should be at least 18 inches in length to enable single fiber cable to be mandrel wrapped for return loss measurements.

Step 1 - Ensure that the cable has been prepared and terminated properly per Method 7A1-1 of this standard.

NOTE: The cable outer jacket should have been stripped back 1.5 m (5 ft) and each OFCC terminated with a terminus.

NOTE: Eight fiber, multimode cable is marked M85045/17-01P. Eight fiber, single mode cable is marked M85045/17-02P.

Step 2 - Install each cable into the interconnection box multiple cable penetrator (MCP) per Method 2B1 of this standard.

Step 3 - Route the 1.5 m (5 ft) of stripped back OFCC's around the interconnection box per Method 2C1 of this standard. All OFCC's shall be routed around the interconnection box at least one complete turn prior to termini insertion into the hermaphroditic receptacle.

NOTE: Routing one-half of the way around the interconnection box then to the termination point is the minimum acceptable routing distance.

Step 4 - Install the termini on the end of the designated OFCCs into the hermaphroditic receptacle per Method 7A1-1 of this standard.

Step 5 - Place a dust cover on the ends of termini not installed into the hermaphroditic receptacle. Tie wrap these OFCC's around the sides of the interconnection box.

METHOD 7C1

UMBILICAL ASSEMBLY CABLE TIE-DOWN GUIDELINES AND PRACTICES

1. SCOPE.

1.1 Scope. This method provides guidelines and practices for deploying the umbilical assembly from the pier to the ship. Method 7C1-1 covers the securing of the umbilical assembly at the pier and on the ship using the umbilical assembly cable grips. Method 7C1-2 covers guidance for placing rat guards on the umbilical assembly.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

- a. Do not stare into the end of a fiber until verifying that the fiber is not connected to a laser light source or LED.

3.2 Procedure I. Method 7C1-1 Securing the umbilical assembly using cable grips. Method 7C1-1 describes procedures for tying down the umbilical assembly at the pier and on the ship using the umbilical assembly cable grips.

3.2.1 Equipment and materials. The equipment and materials in table 7C1-I shall be used to perform this procedure:

TABLE 7C1-I. Equipment and materials.

Description	Quantity
Support grip, single eye, split mesh, lace closing, stainless steel (NAVSEA DWG 7325761-1A-6007AA or equal)	2
Rope	As required
Electrical tie down strap (Tie wraps)	As required
Leather gloves	2 pair
Cloth rags	2
Diagonal cutters (or other cutters for tie wraps)	1

3.2.2 Procedure.

FIGURE 7C1-1. Support grips on umbilical assembly.

Step 1 - Locate the portions of umbilical assembly cable just off the ship and off the pier.

Step 2 - Move the closed mesh support grips on each end of the umbilical assembly to this location.

NOTE: Moving the closed mesh support grips are done by holding one end fixed while increasing the opening of the other end. Compressing both ends like a Chinese finger is less effective.

NOTE: A split mesh, lace closing, support grip can be placed at the desired location in lieu of moving the closed mesh support grip.

NOTE: A split mesh, rod closing, support grip is not authorized for this application. The rigidity of the rod can induce stress concentrations leading to fiber breakage while cable is in use or coiled on the cable reel.

Step 3 - Attach a rope to the single eye on the support grip.

Step 4 - Attach the other end of the rope to a mooring clamp on the pier/ship.

NOTE: Place a drip loop in the cable between the pier and ship. The drip loop is to contain sufficient slack or cable bend to compensate for ship position at high and low tide.

Step 5 - Use electrical tie down straps or other means to secure the umbilical assembly cable when it is routed close to detrimental obstacles (such as near steam lines, at sharp protrusions, on gang planks, nearfoot/vehicle traffic).

3.3 Procedure II. Method 7C1-2 installing rat guards. Method 7C1-2 describes procedures for installing rat guards on the umbilical assembly.

3.3.1 Equipment and materials. The equipment and materials in table 7C1-II shall be used to perform this procedure:

TABLE 7C1-II. Equipment and materials.

Description	Quantity
Rat guard	1
Rubber sheet	As required
Waxed cord (MIL-T-43435 Type I or commercial)	As required

3.3.2 Procedure.

NOTE: A rat guard is a funnel shaped device that is placed on the cable to prevent rodent entry onto a ship via pierside umbilical assembly. The rat guard is usually a two piece construction fabricated by the shipyard/shore activity. The two halves are held together in service by waxed cord or other suitable means. Each shore site determines the requirement/need for a rat guard.

Step 1 - Obtain a rat guard suitable for the umbilical assembly cable diameter.

NOTE: The outside diameter of the umbilical assembly cable may range from a maximum of 16.20 mm (0.639 in) to a minimum of 14.00 mm (0.551 in).

Step 2 - Wrap the rubber sheet around the cable between the two halves of the rat guard.

NOTE: The rubber material is used to distribute the load on the cable from the rat guard.

Step 3 - Using the waxed cord, lash the two halves of the rat guard to the cable.

METHOD 7D1

UMBILICAL ASSEMBLY CABLE SPOOLING OPERATIONS

1. SCOPE.

1.1 Scope. This method describes a procedure for umbilical assembly spooling operations to place and remove the umbilical assembly from the pier to the ship. Method 7D1-1 covers spooling operations using a hand cranked spooling device that conforms to appendix C of CID AA-XX161.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

- a. Do not stare into the end of an umbilical assembly until verifying that the umbilical assembly is not connected (attached to a laser light source or LED).

3.2 Procedure I. Method 7D1-1 Unspooling operation. Method 7D1-1 describes procedures for removing a length of umbilical assembly cable from the cable reel.

3.2.1 Equipment and materials. The equipment and materials in table 7D1-I shall be used to perform this procedure:

TABLE 7D1-I. Equipment and materials.

Description	Quantity
Electrical tie down strap (Tie wraps)	As required
Leather gloves	2 pair
Cloth rags	2
Diagonal cutters (or other cutters for tie wraps)	1
Tek wipes	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required

3.2.2 Procedure.

FIGURE 7D1-1, Electrical tie down straps on umbilical assembly.

3.2.2.1 Place umbilical assembly onto spooling device.

- Step 1 - Release the fastening devices securing the split bushing on the spooling device (see figure 7D1-1).
- Step 2 - Remove the shaft from the spooling device.
- Step 3 - Place the umbilical assembly cable reel onto the square portion of the spooling device shaft and secure it into place with locking pins.
- Step 4 - Place the shaft with the affixed cable reel into the split bushings on the spooling device.
- Step 5 - Secure the fastening devices on the split bushings.

FIGURE 7D1-2. Hand cranked spooling device.

3.2.2.2 Unspool outside end of cable from cable reel (see figure 7D1-2).

NOTE: Use at least two personnel to perform this spooling operation. One person shall operate the spooling device to unspool the cable from the umbilical assembly cable reel, guiding the cable from the cable reel. The other person shall remove the needed cable length from the cable reel.

- Step 1 - Plan the routing of the outside end of the cable.

NOTE: Use the following routing guidelines:

- Do not route near steam lines, other hot objects, sharp penetrations, or vehicle/foot traffic.
- Do not place the cable in a bend with a diameter smaller than 33 cm (13 inches) around corners or other object shapes.
- Station one end of the umbilical assembly within 6.1 m (20 ft) of a mating hermaphroditic receptacle.
- Make sure that the planned cable reel location will be acceptable for the duration of the connection to the pier and the ship.
- Route the umbilical assembly cable in the utility trench, up the side of the gang plank and in other locations where the umbilical assembly cable will not be subjected to damage. Select a route where the cable length is minimized.

- Step 2 - Cut off the electrical tie down straps that secure the connector on the outside end of the cable to either flange (outside or center) of the main cable storage area.

- Step 3 - Put on tight fitting gloves.

- Step 4 - Disengage the locking mechanism on the spooling device shaft to allow cable reel rotation.

- Step 5 - **CAUTION:** Backlash can occur in the cable coming off of the cable reel if the cable is unwound at an uneven rate. Backlash typically will occur if the cable is unwound at widely varying rates. Constant tension on the cable, as it is coming off the cable reel, should minimize any backlash. Constant tension is applied by keeping your hand on top on the cable.

Slowly unwind the umbilical assembly cable from the cable reel while walking the planned cable route. During this time a second person should guide the cable from the cable reel.

NOTE: Do not unwind umbilical assembly cable from back of a truck. Higher unspooling speeds (greater than 10 mph) and backlashes will cause fiber breakage.

NOTE: Walk slowly while unwinding the cable to minimize pulling stresses on the optical fiber.

- Step 6 - Engage the locking mechanism on the spooling device shaft to prevent cable reel rotation once the required cable length is removed from the cable reel.

- Step 7 - Verify that the umbilical assembly cable is free of tangles, obstructions, and obstacles that will interfere with the spooling operation and other hazards listed in step 1.

3.2.2.3 Hand unwind cable inside end from cable reel.

- Step 1 - Plan the routing of the outside end of the cable.

NOTE: Use the following routing guidelines:

- a. Do not route near steam lines, other hot objects, sharp penetrations, or vehicle/foot traffic.
- b. Do not place the cable in a bend with a diameter smaller than 33 cm (13 inches) around corners or other object shapes.
- c. Station one end of the umbilical assembly within 6.1 m (20 ft) of a mating hermaphroditic receptacle.
- d. Make sure that the planned cable reel location will be acceptable for the duration of the connection to the pier and the ship.
- e. Route the umbilical assembly cable in the utility trench, up the side of the gang plank and in other locations where the umbilical cable will not be subjected to damage.
- f. Select a route in which both degree of bends and cable length is minimized.

- Step 2 - Cut off the electrical tie down straps that secure the connector on the inside end of the cable to outside flange of the cable reel pocket.

- Step 3 - Hand unwind the short length of cable (i.e., the 6.1 m (20 ft) length) from the pocket on the cable reel.

NOTE: This end of the cable is called the inside end.

- Step 4 - Verify that the umbilical assembly cable is free of tangles, obstructions, obstacles that will interfere with the spooling operation and other hazards listed in step 1.

3.2.2.4 Connect umbilical assembly connectors to pier and ship (see figure 7D1-3).

FIGURE 7D1-3. Mating hermaphroditic connectors and dust covers.

- Step 1 - Clean any dirt off the surfaces of the connectors and dust covers.
- Step 2 - Unscrew the hermaphroditic cable plug dust cover from hermaphroditic cable plug on the umbilical assembly. Likewise, unscrew the hermaphroditic receptacle dust cover from the hermaphroditic receptacle on the interconnection box.
- Step 3 - Clean the termini in the hermaphroditic cable plug and the hermaphroditic receptacle as specified in 7E1-1.
- Step 4 - Mate the hermaphroditic cable plug with the hermaphroditic receptacle.
- Step 5 - Screw the dust cover on the hermaphroditic receptacle to the dust cover on the hermaphroditic cable plug.
- Step 6 - Repeat steps 1 through 5 for the connection at the other end of the umbilical assembly.

3.3 Procedure II. Method 7D1-2 Spooling operation. Method 7D1-2 describes procedures for placing a length of umbilical assembly cable onto the cable reel.

3.3.1 Equipment and materials. The equipment and materials in table 7D1-II shall be used to perform this procedure:

TABLE 7D1-II. Equipment and materials.

Description	Quantity
Electrical tie down strap (Tie wraps)	As required
Leather gloves	2 pair
Cloth rags	2
Diagonal cutters (or other cutters for tie wraps)	1
Tek wipes	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required

3.3.2 Procedure.

3.3.2.1 Disconnect umbilical assembly connectors from pier and ship.

- Step 1 - Clean any dirt off the surfaces of the mated connectors and the mated dust covers.
- Step 2 - Unscrew the hermaphroditic cable plug dust cover from the hermaphroditic receptacle dust cover (on the interconnection box).
- Step 3 - Unscrew the hermaphroditic cable plug from the hermaphroditic receptacle.

Step 4 - Screw the dust covers onto the the hermaphroditic receptacle at the interconnection box and the hermaphroditic cable plug on the umbilical assembly.

Step 5 - Repeat steps 1 through 4 for the connection at the other end of the umbilical assembly.

3.3.2.2 Place umbilical assembly onto spooling device.

Step 1 - Release the fastening devices securing the split bushing on the spooling device.

Step 2 - Remove the shaft from the spooling device.

Step 3 - Place the umbilical assembly cable reel onto the square portion of the spooling device shaft and secure it into place with locking pins.

Step 4 - Place the shaft with the affixed cable reel into the split bushings on the spooling device.

Step 5 - Secure the fastening devices on the split bushings.

3.3.2.3 Hand wind cable inside end onto cable reel.

Step 1 - Hand wind the short length of cable (i.e., the 6.1 m (20 ft) length) into the pocket on the cable reel.

NOTE: This end of the cable is called the inside end.

Step 2 - Secure the connector on the inside end of the cable to the outside flange of the pocket.

NOTE: Secure the connector in at least 3 places on the flange. Place one electrical tiedown strap at the dust cover in a manner to ensure that connector does not rub against the ground (surface) during transport or during the remainder of the spooling operation.

NOTE: Bungie cord, rope or other means may be used in lieu of electrical tie down straps.

3.3.2.4 Spool outside end of cable onto cable reel.

NOTE: Use at least two personnel to perform this spooling operation. One person shall turn the hand crank, the other shall guide the cable onto the cable reel.

Step 1 - Place the hand crank onto the spooling device shaft and secure it with a locking pin.

Step 2 - Verify that the umbilical assembly cable is free of tangles, obstructions or other obstacles that will interfere with the spooling operation.

NOTE: The umbilical assembly cable may be placed in 30.5 m (100 ft) to 61 m (200 ft) loops (a multiple "S" shape pattern) to ease the spooling operation if a sufficient lay down area is available. A third person, if available, can guide the cable at the end of each loop.

Step 3 - Put on tight fitting gloves while winding the outside end of the cable onto the cable reel.

NOTE: The person guiding the cable onto the cable reel must have tight fitting gloves. Loose fitting gloves can get caught between cable wraps while winding the cable.

Step 4 - CAUTION: While guiding the cable onto the cable reel, keep your hand on top of the cable. If your hand is positioned slightly to the side of the cable, your hand can get caught between cable wraps.

CAUTION: Turn the hand crank slowly to prevent injury (if the hand of the person guiding the cable does get caught between cable wraps).

Turn the hand crank to wind the cable onto the cable reel. A second person should guide the cable onto the cable reel.

NOTE: Turn the hand crank slowly to minimize pulling stresses on the optical fiber.

NOTE: The person guiding the cable should have a rag in the hand that is not on top of cable. Wipe dirt off of the cable using the rag as the cable is wound onto the cable reel.

NOTE: The person guiding the cable should stand on the spooling device frame until enough weight (first few 100 feet of cable) is on the cable reel. This will prevent spooling device movement during the winding operation.

Step 5 - Secure the connector on the outside end of the cable to either flange (outside or center) of the main cable storage area.

NOTE: Secure the connector in at least 3 places on the flange. Place one electrical tie down strap at the dust cover in a manner to ensure that connector does not rub against the ground (surface) during transport.

NOTE: Bungee cord, rope or other means may be used in lieu of electrical tie down straps.

Step 6 - Engage the locking mechanism on the spooling device shaft to prevent cable reel rotation.

Step 7 - Remove the hand crank from the spooling device shaft and place it in the storage position on the spooling device.

3.4 Procedure III. Method 7D1-3 initial spooling operation. Method 7D1-3 describes procedures for placing an umbilical assembly cable on its cable reel using the spooling device.

3.4.1 Equipment and materials. The equipment and materials in table 7D1-III shall be used to perform this procedure:

TABLE 7D1-III. Equipment and materials.

Description	Quantity
Tie wraps	As required
Leather gloves	2 pair
Cloth rags	2
Diagonal cutters (or other cutters for tie wraps)	1
Tek wipes	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required
Tape measure	1

3.4.2 Procedure.

3.4.2.1 Place cable reel onto spooling device.

Step 1 - Release the fastening devices securing the split bushing on the spooling device.

Step 2 - Remove the shaft from the spooling device.

Step 3 - Place the cable reel onto the square portion of the spooling device shaft and secure it into place with the locking pins.

Step 4 - Place the shaft with the affixed cable reel into the split bushings on the spooling device.

Step 5 - Secure the fastening devices on the split bushings.

3.4.2.2 Hand wind cable inside end onto cable reel.

Step 1 - Measure (20 ft) from one end of the cable using a tape measure.

Step 2 - Place the cable on the cable reel at the 6.1 m (20 ft) mark.

NOTE: Position the cable reel such that cable at the 6.1 m (20 ft) mark is lying against the center flange, in the main cable storage area at the opening between the main cable storage area and the starting cable storage area (pocket).

Step 3 - Secure the cable at the 6.1 m (20 ft) mark to the center flange in the main cable storage area using electrical tie down straps.

NOTE: This tie down provision is incorporated into the cable reel to affix the cable so that the inside end of the cable is not removed from the reel during the outside end unwinding operation.

NOTE: Bungie cord, rope or other means may be used in lieu of electrical tie down straps.

Step 4 - Hand wind the 6.1 m (20 ft) of the cable into the pocket on the cable reel.

NOTE: This end of the cable is called the inside end.

Step 5 - Secure the connector on the inside end of the cable to the outside flange of the pocket.

NOTE: Secure the connector in at least 3 places on the flange. Place one electrical tie down strap at the dust cover in a manner to ensure that connector does not rub against the ground (surface) during transport or during the remainder of spooling operation.

3.4.2.3 Spool outside end of cable onto cable reel.

NOTE: Use at least two personnel to perform this spooling operation. One person shall turn the hand crank, the other shall guide the cable onto the cable reel.

Step 1 - Place the hand crank onto the spooling device shaft and secure it with a locking pin.

Step 2 - Verify that the umbilical assembly cable is free of tangles, obstructions or other obstacles that will interfere with the spooling operation.

NOTE: The umbilical assembly cable may be placed in 30.5 m (100 ft) to 61 m (200 ft) loops (a multiple "S" shape pattern) to ease the spooling operation if a sufficient lay down area is available. A third person, if available, can guide the cable at the end of each loop.

Step 3 - Put on tight fitting gloves while winding the outside end of the cable onto the cable reel.

NOTE: The person guiding the cable onto the cable reel must have tight fitting gloves. Loose fitting gloves can get caught between cable wraps while winding the cable.

Step 4 - **CAUTION:** While guiding the cable onto the cable reel, keep your hand on top of the cable. If your hand is positioned slightly to the side of the cable, your hand can get caught between cable wraps.

CAUTION: Turn the hand crank slowly to prevent injury (if the hand of person guiding the cable does get caught between cable wraps).

Turn the hand crank to wind the cable onto the cable reel. A second person should guide the cable onto the cable reel.

NOTE: Turn the hand crank slowly to minimize pulling stresses on the optical fiber.

NOTE: The person guiding the cable should have a rag in the hand that is not on top of cable. Wipe dirt off of the cable using the rag prior to cable being wound on the cable reel.

NOTE: The person guiding the cable should stand on the spooling device frame until enough weight (first few 100 feet of cable) is on the cable reel. This will prevent spooling device movement during the winding operation.

Step 5 - Secure the connector on the outside end of the cable to either flange (outside or center) of the main cable storage area.

NOTE: Secure the connector in at least 3 places on the flange. Place one electrical tie down strap at the dust cover in a manner to ensure that connector does not rub against the ground (surface) during transport.

NOTE: Bungee cord, rope or other means may be used in lieu of electrical tie down straps.

Step 6 - Engage the locking mechanism on the spooling device shaft to prevent cable reel rotation.

Step 7 - Remove the hand crank from the spooling device shaft and place it in the storage position on the spooling device.

METHOD 7E1

CLEANING AND MATING THE HERMAPHRODITIC CONNECTOR

1. SCOPE.

1.1 Scope. This method describes procedures for cleaning a hermaphroditic connector that conforms to CID AA-XX159 prior to mating, cleaning the pin and socket termini that conform to CID AA-XX160 and that are placed in this type of hermaphroditic connector and cleaning of compromised dust covers that conform to CID AA-XX159. Method 7E1-1 covers the connector mating and cleaning without cleaning termini. Method 7E1-2 covers the connector mating with cleaning the termini. Method 7E1-3 covers the dust cover cleaning for de-mating connector operations.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 This section describes cleaning procedures for both hermaphroditic cable plugs and hermaphroditic receptacles. The cleaning procedures are an integral part of the connector mating and de-mating operations; therefore, the cleaning procedures are incorporated into these operations.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

NOTE: Termini are to be cleaned only when required. Cleaning prior to each mating is not required. Cleaning is required when:

- a. The hermaphroditic cable plug or hermaphroditic receptacle dust cover is not mated and the termini end faces are exposed.
- b. The optical signal shows excessive degradation.
- c. Dirt is found in the interior of the dust cover.

3.2 Safety summary. The following safety precautions shall be observed:

- a. Do not stare into the end of an umbilical assembly until verifying that the umbilical assembly is not connected (attached to a laser light source or LED).

3.3 Procedure I. Method 7E1-1 Standard connector mating and cleaning.

NOTE: This procedure is the standard procedure for mating hermaphroditic connectors.

3.3.1 Equipment and materials. The equipment and materials in table 7E1-I shall be used to perform this procedure:

TABLE 7E1-I. Equipment and materials.

Description	Quantity
Cloth rags	As required
Canned air (NAVSEA DWG 7325763-1G-35 or equal)	As required

Step 1 - Clean the outside surfaces of the hermaphroditic connector and the hermaphroditic dust cover with cloth rags.

Step 2 - Remove the dust cover from the hermaphroditic connector.

Step 3 - Blow air across the termini end face.

NOTE: Hold the tube/nozzle on the canned air about a foot from the termini and blow the air across the connector end face. The canned air contains a propellant. Blowing air directly on the connector end face will deposit propellant residue on the termini.

Step 4 - Mate the hermaphroditic cable plug to the hermaphroditic cable plug/ hermaphroditic receptacle.

Step 5 - Tighten the coupling ring on the hermaphroditic cable plug in the forward position until it is hand tight.

Step 6 - Mate the dust cover from the hermaphroditic receptacle to the hermaphroditic cable plug and hand tighten.

3.4 Procedure II. Method 7E1-2 Connector mating with terminus cleaning.

3.4.1 Equipment and materials. The equipment and materials in table 7E1-II shall be used to perform this procedure:

TABLE 7E1-II. Equipment and materials.

Description	Quantity
Cloth rags	As required
Lint free swabs (NAVSEA DWG 7325763-1G-45 or equal)	As required
Wipes, cleaning cloth, white (NAVSEA DWG 7325763-1G-34 or equal)	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air (NAVSEA DWG 7325763-1G-35 or equal)	As required
Allen wrench, 5/64 inch (NAVSEA DWG 7325763-1G-42 or equal)	1

Step 1 - Clean the outside surfaces of the hermaphroditic connector and the hermaphroditic dust cover with cloth rags.

Step 2 - Remove the dust cover from the hermaphroditic connector.

Step 3 - Remove the detachable socket insert from the connector using a 5/64 inch Allen wrench.

Step 4 - Dampen the end of a lint free swab (extra small size) with alcohol.

NOTE: Ensure that a 99 percent pure isopropyl alcohol is used. This alcohol purity may be labeled as USP grade 99 % pure, ASC grade or technical grade. Using an alcohol of lesser purity will leave a residue and complicate further cleaning efforts.

Step 5 - Rotate the lint free swab back and forth across each terminus end face with slight pressure on the terminus end face.

Step 6 - Using slight finger pressure, wipe the cloth wipe back and forth across each terminus end face.

NOTE: Ensure the wipe used is the type specified. Other types of wipes or tissues will deposit lint on the terminus end face or may scratch the glass at the terminus end face.

NOTE: Wipe the end face of each terminus individually. Do not put the wiping area onto adjacent termini, especially already wiped termini.

NOTE: Wipe each terminus using a different area on the cloth wipe. Wiping two termini with the same area on the cloth wipe can leave dirt, from the first terminus on the second.

Step 9 - Blow air across the termini end face.

NOTE: Hold the tube/nozzle on the canned air about a foot from the termini and blow the air across the connector end face. The canned air contains a propellant. Blowing air directly on the connector end face will deposit propellant residue on the termini.

Step 10 - Blow air into each alignment sleeve on the detachable socket insert.

Step 11 - Replace the detachable socket insert onto the connector using a 5/64 inch Allen wrench.

Step 12 - Mate the hermaphroditic cable plug to the hermaphroditic cable plug/ hermaphroditic receptacle.

Step 13 - Tighten the coupling ring on the hermaphroditic cable plug in the forward position until it is hand tight.

Step 14 - Mate the dust cover from the hermaphroditic receptacle to the hermaphroditic cable plug and hand tighten.

3.4 Procedure III. Method 7E1-3 Connector de-mating and dust cover cleaning.

3.4.1 Equipment and materials. The equipment and materials in table 7E1-III shall be used to perform this procedure:

TABLE 7E1-III. Equipment and materials.

Description	Quantity
Cloth rags	As required
Wipes, cleaning cloth, white (NAVSEA DWG 7325763-1G-34 or equal)	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air (NAVSEA DWG 7325763-1G-35 or equal)	As required

Step 1 - Clean the outside surfaces of the hermaphroditic connector and the hermaphroditic dust cover with cloth rags.

Step 2 - Dampen the cloth wipe with alcohol.

Step 3 - Clean each surface of the dust cover interior.

Step 4 - Using a dry, cloth wipe, dry each surface of the dust cover interior.

Step 5 - Blow air into the dust cover interior.

Step 6 - Mate the dust cover onto the hermaphroditic connector and hand tighten.

METHOD 7F1

OPTICAL TESTING OF PIERSIDE CONNECTIVITY CABLE PLANT COMPONENTS

1. SCOPE.

1.1 Scope. This method describes procedures for optical testing of the pierside connectivity cables and interconnection hardware. Method 7F1-1 specifies the cable assembly loss test to be performed on umbilical assemblies, pigtail assemblies, and for terminated shipboard cables. Method 7F1-2 specifies the end-to-end attenuation test from the pigtail assembly at the pier to the outboard most interconnection box on the ship. Method 7F1-3 specifies a hermaphroditic connector measurement quality jumper selection test.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

- a. Do not stare into the end of an umbilical assembly until verifying that the umbilical assembly is not connected to a laser light source or LED.

3.2 Procedure I. Method 7F1-1 cable assembly loss test. Method 7F1-1 describes optical test assemblies, pigtail assemblies, and terminated shipboard cables.

3.2.1 Equipment and materials. The equipment and materials in table 7F1-I shall be used to perform this procedure:

TABLE 7F1-I. Equipment and materials.

Description	Quantity
LED source (NSN 7Z 6625 01 304 1739 or NAVSEA DWG 7325763-1B [item 6009BA] or equal)	1
Laser (LD) source (NAVSEA DWG 7325763-1B [item 6009BB] or equal)	1
Powermeter (NSN 7Z 6625 01 304 1739 or NAVSEA DWG 7325763-1B [item 6009BA] or equal)	
MQJ, ST-to-ST connector, 1 meter length, multimode (NAVSEA DWG 7325763-1D [item 6009AX] or equal)	2
MQJ, ST-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1D [item 6009AY] or equal)	2
ST-to-ST adapter, single mode, split ceramic alignment sleeve, metal housing (NAVSEA DWG 7325763-1D [item 6007AB] or equal)	2
MQJ, hermaphroditic cable plug to ST connector, 1 meter length (NAVSEA DWG 7325763-1E [item 6009AQ] or equal)	2
MQJ, Socket termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AJ] or equal)	2
MQJ, Pin termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AK] or equal)	2
MQJ, Socket termini-to-ST connector, 1 meter length, multimode (NAVSEA DWG 7325763-1F [item 6009AL] or equal)	2
MQJ, Pin termini-to-ST connector, 1 meter length, multimode (NAVSEA DWG 7325763-1F [item 6009AM] or equal)	2
Snap lock, plug, termini-to-termini connection device (NAVSEA DWG 7325763-1F [item 6009AP] or equal)	2
Snap lock, receptacle, termini-to-termini connection device (NAVSEA DWG 7325763-1F [item 6009AR] or equal)	2
Termini insertion tool, straight, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal)	1

TABLE 7F1-I. Equipment and materials (continued).

Description	Quantity
Termini removal tool, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal	1
Alignment sleeve insertion and removal tool, M29504 (NAVSEA DDWG 7325763 [item 6009BH] or equal	1
Tek wipes	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required

3.2.2 Multimode cable assembly loss test. Perform the multimode cable assembly loss test as follows:

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that both the light source and power meter have been energized long enough to have stable performance before making measurements.
 4. The time delay between the P_1 measurement and the P_2 measurements shall be kept to a minimum to prevent inaccurate measurements.

Step 1 - Connect the two ends of the ST-to-ST MQJ (reference cable) to the source and power meter per the setup in table 7F1-II and applicable figure (see figures 7F1-1 through 7F1-6).

Table 7F1-II Reference cable measurement setup.

Cable assembly Fiber type	Source end (MQJ 1) attachment	Power Meter end (MQJ 2) attachment
Multimode	One end of ST-to-ST connector MQJ 6009AX	Other end of ST-to-ST connector MQJ 6009AX

Step 2 - Measure and record the reference power, designated as P_1 , in dBm.

NOTE: The value obtained for the reference power, P_1 , must be consistent from test to test. Changes in the reference power, P_1 , greater than 0.5 dB indicate a defective MQJ or an unstable light source. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 3 - Connect the cable assembly under test to the optical source and power meter per setup in Table 7F1-IV and applicable figure (see figures 7F1-1 through 7F1-6).

a. Source/power meter to MQJ connections.

- (1) Connect the ST connector end of one MQJ (MQJ 1), or connect one ST connector of a multiple fiber MQJ (MQJ 1), to the LED source.

NOTE: For cables with single terminus, Straight Tip (ST) connectors on one or both ends, the reference cable should be used as MQJ 1.

- (2) Connect the ST connector of another MQJ (MQJ 2), or connect one ST connector of a multiple fiber MQJ (MQJ 2) to the power meter.

- ① Light Source (MM - Use LED source, SM - Use Source)
- ② Power Meter
- ③ Hermaphroditic MQJ
- ④ Cable Assembly Under Test
- ⑤ ST-to-ST MQJ (MM - use MM MQJ; SM - use SM MQJ)

FIGURE 7F1-1. Cable assembly measurement: Cable-to-cable plug configuration (example: umbilical assembly)

- ① Light Source (MM - Use LED source, SM - Use LD source)
- ② Power Meter
- ③ Hermaphroditic MQJ
- ④ ST - to - ST MQJ (MM - Use MM MQJ, SM - Use SM MQJ)
- ⑤ Cable Assembly Under Test
- ⑥ ST - to - ST Adapter

FIGURE 7F1-2. Cable assembly measurement: receptacle-to-ST configuration (example: pigtail assembly).

Figure 7F1-3. Cable assembly measurement: socket terminus-to-pin terminus configuration
(example: port-to-starboard cable assembly)

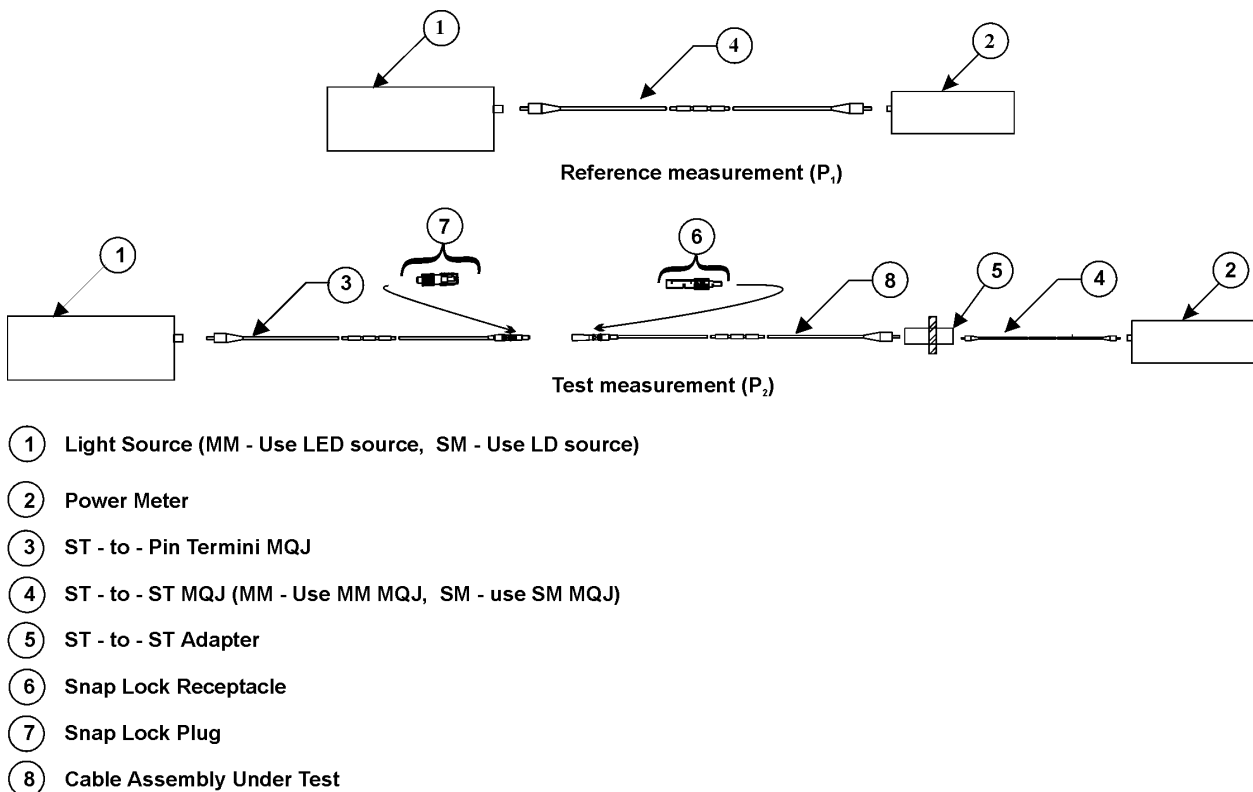

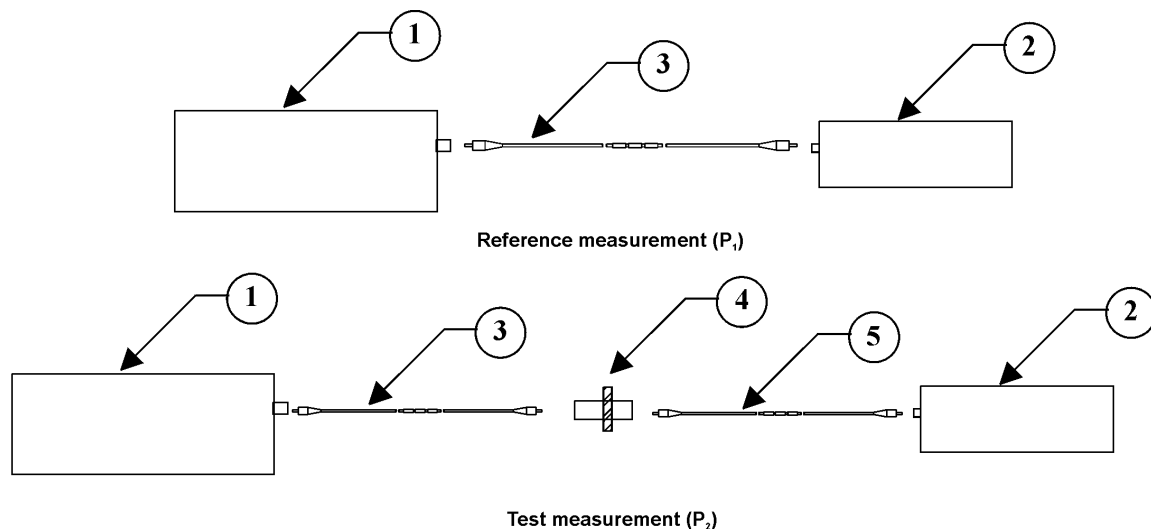

Figure 7F1-4. Cable assembly measurement: socket terminus-to-ST configuration.
(example: port-to-radio room and starboard-to-radio room cable assemblies)

- ① Light Source (MM - Use LED source, SM - Use LD source)
- ② Power Meter
- ③ ST - to - Pin Termini MQJ
- ④ ST - to - ST MQJ (MM - Use MM MQJ, SM - use SM MQJ)
- ⑤ ST - to - ST Adapter
- ⑥ Snap Lock Receptacle
- ⑦ Snap Lock Plug
- ⑧ Cable Assembly Under Test

Figure 7F1-5. Cable assembly measurement: pin termini-to-ST configuration
(example: port-to-radio room and starboard-to-radio room cable assemblies).

- ① Light Source (MM - Use LED source, SM - Use LD source)
- ② Power Meter
- ③ ST-to-ST MQJ (MM - Use MM MQJ, SM - use SM MQJ)
- ④ ST- to-ST Adapter
- ⑤ Cable Assembly Under Test

Figure 7F1-6. Cable assembly measurement: ST-to-ST configuration
(Example: acceptance test for ST-to-ST MQJ)

b. MQJ to cable assembly under test connections.

- (1) Connect one end of the cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of MQJ 1.
- (2) Connect the other end of the cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of the MQJ 2.

NOTE: If the cable assembly contains termini that are not installed in a hermaphroditic connector, use the snap lock plug and receptacle to mate the MQJ terminus to the cable assembly terminus.

Step 4 - Measure and record the test power, designated as P_2 , in dBm.

NOTE: A test power, P_2 , greater the reference power, P_1 , or greater than a zero reference level indicates an improper measurement. In general, this may be caused by a defective or dirty MQJ used for the reference measurement. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 5 - Repeat steps 3 and 4 for each multimode fiber in the cable.

Step 6 - Calculate the cable assembly loss per 3.2.4 for each fiber in the cable.

3.2.3 Single mode cable assembly loss test. Perform the single mode cable assembly loss test as follows:

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that both the light source and power meter have been energized long enough to have stable performance before making measurements.
 4. The time delay between the P_1 measurement and the P_2 measurements shall be kept to a minimum to prevent inaccurate measurements.

Step 1 - Connect the two ends of the ST-to-ST MQJ (reference cable) to the source and power meter per the setup in table 7F1-III and applicable figures (see figures 7F1-1 through 7F1-6).

Table 7F1-III Reference cable measurement setup.

Cable assembly Fiber type	Source end (MQJ 1) attachment	Power Meter end (MQJ 2) attachment
Single mode	One end of ST-to-ST connector MQJ 6009AY	Other end of ST-to-ST connector MQJ 6009AY

Step 2 - Place a loop, with a diameter of approximately 1 inch, in the cable of MQJ 1.

Step 3 - Measure and record the reference power, designated as P_1 , in dBm.

NOTE: The value obtained for the reference power, P_1 , must be consistent from test to test. Changes in the reference power, P_1 , greater than 0.5 dB indicate a defective MQJ or an unstable light source. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Table 7F1-IV Cable assembly loss measurement setup.

Cable assembly	Cable assembly ends terminated with	MQJ (J1) connected to light source	Adapter connecting J1 to the cable assembly under test	Cable assembly being tested	Adapter connecting J2 to the cable assembly under test	MQJ (J2) connected to power meter
Umbilical Assembly	Cable plug –both ends	ST end of MQJ 6009AQ	Not applicable	See columns 1 & 2	Not applicable	ST end of second MQJ 6009AQ
Pigtail Assembly	Config 1: Cable plug to ST single mode (SM)	ST end of MQJ 6009AQ with a SM fiber	Not applicable	See columns 1 & 2	ST-to-ST adapter 6007AB	One ST end of SM ST-to-ST MQJ 6009AY
Pigtail Assembly	Config 2: Cable plug to ST multimode (MM)	ST end of MQJ 6009AQ with a MM fiber	Not applicable	See columns 1 & 2	ST-to-ST adapter 6007AB	One ST end of MM ST-to-ST MQJ 6009AX
Cable from port/starboard/midship/sail to radio room	Config 1: socket termini to ST, single mode (SM)	ST end of SM ST-to-pin termini MQJ 6009AK	Plug snap lock 6009AP on MQJ; receptacle snap lock 6009AR on cable assembly	See columns 1 & 2	ST-to-ST adapter 6007AB	One ST end of SM ST-to-ST MQJ 6009AY
Cable from port/starboard/midship/sail to radio room	Config 2: pin termini to ST, single mode (SM)	ST end of SM ST-to-socket termini MQJ 6009AK	Receptacle snap lock 6009AR on MQJ; plug snap lock 6009AP on cable assembly	See columns 1 & 2	ST-to-ST adapter 6007AB	One ST end of SM ST-to-ST MQJ 6009AY
Cable from port/starboard/midship/sail to radio room	Config 3: socket termini to ST, multimode (MM)	ST end of MM ST-to-pin termini MQJ 6009AL	Plug snap lock 6009AP on MQJ; receptacle snap lock 6009AR on cable assembly	See columns 1 & 2	ST-to-ST adapter 6007AB	One ST end of MM ST-to-ST MQJ 6009AX
Cable from port/starboard/midship/sail to radio room	Config 4: socket termini to ST, multimode (MM)	ST end of MM ST-to-socket termini MQJ 6009AM	Receptacle snap lock 6009AR on MQJ; plug snap lock 6009AP on cable assembly	See columns 1 & 2	ST-to-ST adapter 6007AB	One ST end of MM ST-to-ST MQJ 6009AX
Cable from port to starboard	Config 1: socket termini to pin termini, single mode (SM)	ST end of SM ST-to-pin termini MQJ 6009AK	Plug snap lock 6009AP on MQJ; receptacle snap lock 6009AR on cable assembly	See columns 1 & 2	Receptacle snap lock 6009AR on MQJ; plug snap lock 6009AP on cable assembly	ST end of SM ST-to-socket termini MQJ 6009AJ
Cable from port to starboard	Config 2: socket termini to pin termini, multimode (MM)	ST end of MM ST-to-pin termini MQJ 6009AL	Plug snap lock 6009AP on MQJ; receptacle snap lock 6009AR on cable assembly	See columns 1 & 2	Receptacle snap lock 6009AR on MQJ; plug snap lock 6009AP on cable assembly	ST end of MM ST-to-socket termini MQJ 6009AM

Step 4 - Connect the cable assembly under test to the optical source and power meter per setup in table 7F1-IV and applicable figure (see figures 7F1-1 through 7F1-6).

a. Source/power meter to MQJ connections.

- (1) Connect the ST connector end of one MQJ (MQJ 1), or connect one ST connector of a multiple fiber MQJ (MQJ 1), to the Laser (LD) source.

NOTE: For cables with single terminus, Straight Tip (ST) connectors on one or both ends, the reference cable should be used as MQJ 1.

- (2) Place a loop, with a diameter of approximately one inch, in the cable of MQJ 1 cable, or in each cable of a multiple fiber MQJ 1.
- (3) Connect the ST connector of another MQJ (MQJ 2), or connect one ST connector of a multiple fiber MQJ (MQJ 2) to the power meter.

b. MQJ to cable assembly under test connections.

- (1) Connect one end of the cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of MQJ 1.
- (2) Connect the other end of the cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of the MQJ 2.

NOTE: If the cable assembly contains termini that are not installed in a hermaphroditic connector, use the snap lock plug and receptacle to mate the MQJ terminus to the cable assembly terminus.

Step 5 - Measure and record the test power, designated as P_2 , in dBm.

NOTE: A test power, P_2 , greater the reference power, P_1 , or greater than a zero reference level indicates an improper measurement. In general, this may be caused by a defective or dirty MQJ used for the reference measurement. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 6 - Repeat steps 3 and 4 for each single mode fiber in the cable.

Step 7 - Calculate the cable assembly loss per 3.2.4 for each fiber in the cable.

3.2.4 Cable assembly loss calculation for each fiber.

Step 1 - Calculate the cable assembly loss for each fiber using the following formula and record the results:

$$B_{CA} = (P_1 - P_2)$$

Where: B_{CA} = Total cable assembly loss in dB
 P_1 = Reference power in dBm
 P_2 = Test power in dBm

Step 2 - Compare the test results with table 7F1-V for the maximum acceptable loss.

NOTE: The cable assembly is considered acceptable if the measured loss is less than or equal to the maximum acceptable loss. If the measured loss is acceptable, proceed to step 4 below. If the measured loss is greater than the maximum acceptable loss, proceed to step 3 below.

Table 7F1-V Maximum acceptable loss for cable assembly

Cable assembly under test	Single mode	Multimode
Umbilical assembly (500ft)	1.7 dB	1.8 dB
Umbilical assembly (100ft)	1.5 dB	1.6 dB
Cross connect assembly	1.5 dB	1.5 dB
ST to termini cable assembly (assume 250 ft cable run)	1.6 dB	1.7 dB
Termini to termini cable assembly (assume 500 ft cable run)	1.7 dB	1.8 dB
Pigtail assembly with ST's	1.5 dB	1.5 dB
Pigtail assembly without ST's	1.5 dB	1.5 dB

Step 3 - If the measured loss is 0.5 dB or more above the maximum acceptable loss, reject the cable assembly. If the measured loss is less than 0.5 dB above the maximum acceptable loss, disconnect and clean all the connections and retest. If the loss is still unacceptable, reterminate or replace the defective components.

Step 4 - If the cable is not going to be installed within 48 hours, install protective caps over the connectors/termini.

3.3 Procedure II. Method 7F1-2 End-to-end attenuation test. Method 7F1-2 describes optical testing of two or more concatenated optical assemblies (two or more individual cable assemblies connected together in series). Perform the end-to-end attenuation test as follows:

3.3.1 Equipment and materials. The equipment and materials in table 7F1-I shall be used to perform this procedure.

3.3.2 Multimode end-to-end attenuation test.

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:**
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that both the light source and power meter have been energized long enough to have stable performance before making measurements.
 4. The time delay between the P_1 measurement and the P_2 measurements shall be kept to a minimum to prevent inaccurate measurements.

Step 1 - Connect the two ends of the ST-to-ST MQJ (reference cable) to the source and power meter per the setup in table 7F1-II and applicable figure (see figures 7F1-1 through 7F1-6).

Step 2 - Measure and record the reference power, designated as P_1 in dBm.

NOTE: The value obtained for the reference power, P_1 , must be consistent from test to test. Changes in the reference power, P_1 , greater than 0.5 dB indicate a defective MQJ or an unstable light source. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 3 - Connect the concatenated cable assembly under test to the optical source and power meter per setup in table 7F1-IV) and applicable figure (see figures 7F1-1 through 7F1-6).

- a. Source/power meter to MQJ connections.

- (1) Connect the ST connector end of one MQJ (MQJ 1), or connect one ST connector of a multiple fiber MQJ (MQJ 1), to the LED source.

NOTE: For concatenated optical assemblies with single terminus, Straight Tip (ST) connectors on one or both ends, the reference cable should be used as MQJ 1.

- (1) Connect the ST connector of another MQJ (MQJ 2), or connect one ST connector of a multiple fiber MQJ (MQJ 2), to the power meter.

b. MQJ to concatenated cable assembly connections.

- (1) Connect one end of the concatenated cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of MQJ 1.
- (2) Connect the other end of the concatenated cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of MQJ 2.

NOTE: If the concatenated cable assembly under test contains termini that are not installed in a hermaphroditic connector, use the snap lock plug and receptacle to mate the MQJ terminus to the cable assembly terminus.

Step 4 - Measure and record the test power, designated as P_2 in dBm.

NOTE: A test power, P_2 , greater the reference power, P_1 , or greater than a zero reference level indicates an improper measurement. In general, this may be caused by a defective or dirty MQJ used for the reference measurement. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 5 - Repeat steps 3 and 4 for each multimode fiber in the concatenated cable assembly.

Step 6 - Calculate the end-to-end attenuation per 3.3.4 for each fiber in the cable.

3.3.3 Single mode end-to-end attenuation test.

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that both the light source and power meter have been energized long enough to have stable performance before making measurements.
 4. The time delay between the P_1 measurement and the P_2 measurements shall be kept to a minimum to prevent inaccurate measurements.

Step 1 - Connect the two ends of the ST-to-ST MQJ (reference cable) to the source and power meter per the setup in table 7F1-III and applicable figure (see figures 7F1-1 through 7F1-6).

Step 2 - Place a loop, with a diameter of approximately 1 inch, in the cable of MQJ 1.

Step 3 - Measure and record the reference power, designated as P_1 in dBm.

NOTE: The value obtained for the reference power, P_1 , must be consistent from test to test. Changes in the reference power, P_1 , greater than 0.5 dB indicate a defective MQJ or an unstable light source. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 4 - Connect the concatenated cable assembly under test to the optical source and power meter per setup in table 7F1-IV and applicable figure (see figures 7F1-1 through 7F1-6).

- a. Source/power meter to MQJ connections.

- (1) Connect the ST connector end of one MQJ (MQJ 1), or connect one ST connector of a multiple fiber MQJ (MQJ 1), to the Laser (LD) source.

NOTE: For concatenated optical assemblies with single terminus, Straight Tip (ST) connectors on one or both ends, the reference cable should be used as MQJ 1.

- (2) Place a loop, with a diameter of approximately 1 inch, in the cable of MQJ 1, or in each cable of a multiple fiber MQJ 1.
- (3) Connect the ST connector of another MQJ (MQJ 2), or connect one ST connector of a multiple fiber MQJ (MQJ 2), to the power meter.

b. MQJ to concatenated optical assemblies under test connections.

- (1) Connect one end of the concatenated cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of MQJ 1.
- (2) Connect the other end of the concatenated cable assembly under test, or one fiber in that cable assembly (as applicable), to the mating end of MQJ 2.

NOTE: If the concatenated cable assembly contains termini that are not installed in a hermaphroditic connector, use the snap lock plug and receptacle to mate the MQJ terminus to the cable assembly terminus.

Step 5 - Measure and record the test power, designated as P_2 in dBm.

NOTE: A test power, P_2 , greater the reference power, P_1 , or greater than a zero reference level indicates an improper measurement. In general, this may be caused by a defective or dirty MQJ used for the reference measurement. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 6 - Repeat steps 3 and 4 for each single mode fiber in the concatenated cable assembly.

Step 7 - Calculate the end-to-end attenuation per 3.3.4 for each fiber in the concatenated cable assembly.

3.3.4 End-to-end attenuation loss calculation for concatenated optical assemblies.

Step 1 - Calculate the end-to-end attenuation for each fiber in the concatenated cable assembly using the following formula and record the results:

$$B_{TL} = (P_1 - P_2)$$

Where:

B_{TL}	= Total concatenated cable assembly end-to-end attenuation in dB
P_1	= Reference power in dBm
P_2	= Test power in dBm

Step 2 - Compare the test results with the maximum acceptable loss for the concatenated cable assembly (See 3.3.5 to calculate the maximum acceptable loss).

NOTE: The concatenated cable assembly is considered acceptable if the measured loss is less than or equal to the maximum acceptable loss. If the measured loss is acceptable, proceed to step 4 below. If the measured loss is greater than the maximum acceptable loss, proceed to step 3 below.

Step 3 - If the measured end-to-end attenuation is 1.0 dB or more above the maximum acceptable loss, reject the concatenated cable assembly. If the measured end-to-end attenuation is less than 1.0 dB above the maximum acceptable loss, disconnect and clean all of the connections and retest. If the end-to-end attenuation is still unacceptable, reterminate or replace the defective components.

- Step 4 - If the concatenated cable assembly is not going to be immediately connected to mating connectors, install protective caps over the connectors/termini.

3.3.5 Maximum acceptable loss calculations for concatenated optical assemblies.

- Step 1 - Calculate the maximum acceptable concatenated cable assembly loss from the maximum component loss values shown in table 7F1-VI using the following formula:

$$MAL = (A_{ca})(L) + \sum L_{co}$$

Where: MAL = Maximum acceptable loss
 A_{ca} = Maximum attenuation of the cable
 L = Length of the cable
 L_{co} = Maximum loss of a connector mated pair

TABLE 7F1-VI. Maximum component loss values.

Component	Single mode	Multimode
Cable	1.0 dB/km @ 1300 nm	3.5 dB/km @ 850 nm 2.0 dB/km @ 1300 nm
Single terminus, Straight Tip (ST) connector (mated pair)	0.75 dB maximum (0.5 dB average)	0.75 dB maximum (0.5 dB average)
Multiple termini (hermaphroditic) connector (mated pair)	0.75 dB maximum (0.5 dB average)	0.75 dB maximum (0.5 dB average)

NOTE: Use maximum loss values for acceptable loss calculations.

METHOD 7G1

PIER INTERCONNECTION BOX INSTALLATION

1. SCOPE.

1.1 Scope. This method describes procedures for pier interconnection box installation.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

- a. Do not stare into the end of a fiber until verifying that the fiber is not connected to a laser light source or LED.

3.2. Interconnection box installation.

3.2.1 The interconnection box and the equipment in table 7G1-I shall be used to perform this installation.

TABLE 7G1-I. Equipment and materials.

Description	Quantity
D hole punch (NAVSEA DWG 7325763-1H-6009AH or equal)	1
Interconnection box (NAVSEA DWG 7325761-2-6003AK or equal)	1
Patch panels for interconnection box (NAVSEA DWG 7325761-2-6003AL or equal)	6
Pigtail assembly (NAVSEA DWG 7325760-1B-6000AC or equal)	1
ST-to-ST adapter, single mode, nickel plated brass or stainless steel housing (NAVSEA DWG 7325761-1A-6007AB or equal)	36
Wrench, 1-7/8 inch, open end	1
Wrench, 2 inch, open end	1

3.2.2 Procedure I. Method 7G1-1 Interconnection box installation (see figure 7G1-1). This installation includes pigtail assembly installation with cable routing.

NOTE: Steps 1 and 2 pertain only when installing the interconnection box listed in table 7G1-I.

- Step 1 - Install captive screws on the cover as the means to keep interconnection box cover closed. Interconnection box comes with two options to keep the cover closed (other is quick release latch).
- Step 2 - Use D hole punch to place a "D hole" in the middle of the interconnection box side panel as shown in figure 7G1-1.
- Step 3 - Use a round conduit punch to place the applicable size hole in bottom of interconnection box for trunk cable entrance.
- Step 4 - Place single mode ST-to-ST adapters onto each patch panel.
- Step 5 - Secure each patch panel inside of the interconnection box.
- Step 6 - Install the interconnection box onto the mounting surface using the metal mounting bracket on the back of the interconnection box (an optional method is to remove the mounting bracket and use the interconnection box holes).

Step 7 - Caution: Do not place a seal or compound into the trunk cable conduit leading to the interconnection box. If the conduit is sealed and the interconnection box is heated by the sun, a partial vacuum may be formed. This partial vacuum will prevent opening of the interconnection box until cooled or another hole is made.

Place the conduit fitting into the round interconnection box hole and secure the conduit to the conduit fitting.

Step 8 - Remove the large nut on the hermaphroditic receptacle on the pigtail assembly.

Step 9 - Place the hermaphroditic receptacle inside the interconnection box and through the D hole.

Step 10 - Place and tighten the nut onto the hermaphroditic receptacle.

NOTE: Use a 1-7/8 inch wrench to tighten the nut. Use a 2 inch wrench inside the interconnection box to hold the hermaphroditic connector while tightening the nut.

Step 11 - Route the 1.5 m (5 ft) single fiber cables on the pigtail assembly around the interconnection box using the cable guides. All single fiber cables on the pigtail assembly shall be routed at least once around the interconnection box prior to ST connector placement into a ST-to-ST adapter.

NOTE: Routing one-half of the way around the interconnection box then to the termination point is the minimum acceptable routing distance.

NOTE: Exposed portion of single mode, single fiber cable at the end of a multiple fiber cable should be at least 18 inches in length to enable single fiber cable to be mandrel wrapped for return loss measurements.

Step 12 - Place the ST connector on each pigtail assembly single fiber cable into the designated ST-to-ST adapter

D Hole Orientation: flat faces front (the cover).

FIGURE 7G1-1. D hole orientation.

METHOD 7H1

HERMAPHRODITIC CONNECTOR POSITIONS, MATING AND CONCATENATION

1. SCOPE.

1.1 Scope. This method describes procedures for configuring the hermaphroditic cable plug for mating with a hermaphroditic receptacle or another hermaphroditic cable plug. Method 7H1-1 covers placing the hermaphroditic cable plug in the forward position and in the back position. Method 7H1-2 covers concatenation of a hermaphroditic cable plug with a crossconnect assembly. (See paragraph 7.1 of this standard practice for more detail.)

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

- a. Do not stare into the end of a fiber until verifying that the fiber is not connected to a laser light source or LED.

3.2 Cleaning. Perform cleaning per Method 7E1-1 of this standard prior to hermaphroditic connector mating and per Method 7E1-3 prior to connector de-mating.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.3 Procedure I. Method 7H1-1 Positioning and mating a hermaphroditic cable plug (see figure 7H1-1). Method 7H1-1 describes placing a hermaphroditic cable plug in the forward and back positions and mating in each of the two positions.

FIGURE 7H1-1. Hermaphroditic connector mating.

3.3.1 Equipment and materials. The equipment and materials in tables 7E1-I shall be used to perform cleaning prior to these procedures.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.3.2 Placing the hermaphroditic cable plug in the forward position.

Step 1 - Verify that the hermaphroditic cable plug is in the back position by observing that the external threads are completely exposed (see figure 7H1-1).

NOTE: The hermaphroditic cable plug is locked in the back position.

Step 2 - Rotate the coupling ring on the hermaphroditic cable plug clockwise (when observed from hermaphroditic cable plug front face) until it disengages from the rear threads.

Step 3 - Push coupling ring forward (towards front face) until a physical stop is reached.

Step 4 - Rotate the coupling ring counterclockwise (when observed from hermaphroditic cable plug front face) until it rotates through the threads and then disengages.

3.3.3 Mating the hermaphroditic cable plug in the forward position.

Step 1 - Verify that the hermaphroditic cable plug in the forward position is being mated with either a hermaphroditic cable plug in the back position or a hermaphroditic receptacle.

Step 2 - Align the two front faces so that the protruding, horizontal flat surface of each hermaphroditic connector comes into contact with and slides into the recess of the other connector.

Step 3 - Press the two front faces together until they come to a stop.

Step 4 - Rotate the coupling ring on the hermaphroditic cable plug in the forward position in a clockwise direction (when observed from hermaphroditic cable plug front face) until a physical stop is reached.

NOTE: The coupling ring hits a stop at this point and cannot be further tightened.

3.3.4 Placing the hermaphroditic cable plug in the back position.

Step 1 - Verify that the hermaphroditic cable plug is in the forward position by observing that the internal threads are completely exposed (see figure 7H1-1).

Step 2 - Start by pulling the coupling ring on the hermaphroditic cable plug towards the cable until the coupling ring reaches a stop.

Step 3 - Rotate the coupling ring on the hermaphroditic cable plug counterclockwise (when observed from hermaphroditic cable plug front face) so that the coupling ring threads engage.

Step 4 - Continue to rotate the coupling ring counterclockwise until it disengages from the threads.

Step 5 - Pull the coupling ring towards the cable until either:

- a. The back of the coupling ring reaches a stop and is in contact with the wave washer.
- b. The back of the coupling ring reaches a stop before coming into contact with the wave washer. Perform the following to place the coupling ring in contact with the wave washer:
 - (1) Slowly rotate the coupling ring clockwise (when observed from hermaphroditic cable plug front face) until a key engagement is felt.

(2) Pull the coupling ring towards the cable until contact is made with the wave washer.

Step 6 - Rotate the coupling ring clockwise (when observed from hermaphroditic cable plug front face) until a stop is reached.

NOTE: This last step places the hermaphroditic cable plug in a "locked" back position.

3.3.5 Mating the hermaphroditic cable plug in the back position (see figure 7H1-1).

Step 1 - Verify that the hermaphroditic cable plug in the back position is being mated with a hermaphroditic cable plug in the forward position.

Step 2 - Align the two front faces so that the protruding, horizontal flat surface of each hermaphroditic connector comes into contact with and slides into the recess of the other connector.

Step 3 - Press the two front faces together until they come to a stop.

Step 4 - Rotate the coupling ring on the hermaphroditic cable plug in the forward position clockwise (when observed from hermaphroditic cable plug front face) until a physical stop is reached.

NOTE: The coupling ring hits a stop at this point and cannot be further tightened.

3.4 Procedure II. Method 7H1-2 Concatenating a crossconnect assembly with a hermaphroditic cable plug. Method 7H1-2 describes the attachment (concatenation procedure) of a crossconnect assembly with a hermaphroditic cable plug on the umbilical assembly.

3.4.1 Equipment and materials. The equipment and materials in tables 7E1-I shall be used to perform cleaning prior to this procedure.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.4.2 Concatenation of a crossconnect assembly with an umbilical assembly.

Step 1 - Remove the dust cover on the hermaphroditic connector of the crossconnect assembly that is in the back position

Step 2 - Remove the dust cover on the umbilical assembly.

Step 3 - Mate the hermaphroditic cable plug of the crossconnect assembly to the hermaphroditic plug of the umbilical assembly using method 7H1-1.

Step 4 - Mate the dust cover on the umbilical assembly with the dust cover on the crossconnect assembly.

3.5 Procedure III. Method 7H1-3 Attachment of an umbilical assembly or crossconnect assembly with a hermaphroditic receptacle. Method 7H1-3 describes the attachment of an umbilical assembly or a crossconnect assembly with a hermaphroditic receptacle.

3.5.1 Equipment and materials. The equipment and materials in tables 7E1-I shall be used to perform cleaning prior to this procedure.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.5.2 Attachment of an umbilical assembly or a crossconnect assembly with a hermaphroditic receptacle.

Step 1 - Remove the dust cover from the end of the umbilical assembly or the crossconnect assembly (with the hermaphroditic cable plug in the forward position).

Step 2 - Remove the dust cover from the hermaphroditic receptacle on the interconnection box.

- Step 3 - Mate the hermaphroditic cable plug of the umbilical assembly or the crossconnect assembly to the hermaphroditic receptacle using method 7H1-1.
- Step 4 - Mate the dust cover on the umbilical assembly or the crossconnect assembly with the dust cover on the hermaphroditic receptacle.

METHOD 711

OPTICAL RETURN LOSS TESTING OF PIERSIDE CONNECTIVITY CABLE ASSEMBLIES

1. SCOPE.

1.1 Scope. This method describes procedures for optical return loss testing of pierside connectivity cable assemblies. Optical return loss testing is performed only on single mode cable assemblies or the single mode portion of a hybrid cable assembly. Method 711-1 specifies an optical return loss test for a single cable assembly. Method 711-2 specifies the optical return loss test for two or more concatenated cable assemblies.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

a. Do not stare into the end of a fiber until verifying that the fiber is not connected to a laser light source or LED.

3.2 Cleaning. Perform cleaning per Method 7E1-1 of this standard prior to hermaphroditic connector mating and per Method 7E1-3 prior to connector de-mating.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.3 Procedure I. Method 711-1 Cable assembly optical return loss measurement. Method 711-1 describes an optical test to determine the optical return loss for a single cable assembly (single mode fibers only).

3.3.1 Equipment and materials. The equipment and materials in table 711-I shall be used to perform cleaning prior to these procedures.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

TABLE 711-I. Equipment and materials.

Description	Quantity
ORLM (Optical Return Loss Meter) (Noyes Fiber Systems Model ORL 3 or equal)	1
MQJ, ST-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1D [item 6009AY] or equal)	2
SC-to-ST adapter, single mode, split ceramic alignment sleeve, metal housing (NAVSEA DWG 7325763-1D [item 6007BE] or equal)	2
ST-to-ST adapter, single mode, split ceramic alignment sleeve, metal housing (NAVSEA DWG 7325763-1D [item 6007AB] or equal)	2
MQJ, hermaphroditic cable plug to ST connector, 1 meter length (NAVSEA DWG 7325763-1E [item 6009AQ] or equal)	2
MQJ, Socket termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AJ] or equal)	2
MQJ, Pin termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AK] or equal)	2
Snap lock, plug, termini-to-termini connection device (NAVSEA DWG 7325763-1F [item 6009AP] or equal)	2
Snap lock, receptacle, termini-to-termini connection device (NAVSEA DWG 7325763-1F [item 6009AR] or equal)	2

TABLE 711-I. Equipment and materials (continued).

Description	Quantity
Termini insertion tool, straight, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal)	1
Termini removal tool, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal)	1
Alignment sleeve insertion and removal tool, M29504 (NAVSEA DWG 7325763 [item 6009BH] or equal)	1
Tek wipes	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required

3.3.2 ORLM (Optical Return Loss Meter) setup and optical return loss measurement. Perform the optical return loss measurement as follows:

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:**
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that the ORLM has been energized for at least 3 minutes to ensure stable performance before making measurements.

- Step 1 - Energize the ORLM.
- Step 2 - Select the optical return loss mode. Press the [Select Test] key until the "ORL" designator is selected by an arrow head on the LCD display.
- Step 3 - Select the 1310 nm wavelength. Press the [λ] key until 1310 nm is selected.
- Step 4 - Obtain the jumper cable supplied with the ORLM. Attach the APC SC connector to the ORLM optical connector interface port.

NOTE: Use appropriate configuration see figures 711-1 through 711-5.

NOTE: The connector with the green boot is the ORLM jumper cable end connected to the transmit port.

- Step 5 - Attach the SC end of a SC-to-ST adapter to the other end of the ORLM jumper cable.
- Step 6 - Select a MQJ for each end of the cable assembly under test.
- a. Refer to table 7F1-IV to select the proper MQJ for each cable assembly configuration.
 - b. Place a loop, with a diameter of approximately one inch, in the MQJ 1 cable, or in each single fiber cable of a multiple fiber MQJ 1.

- Step 7 - Connect an ST connector from MQJ 1 to the ST end of the SC-to-ST adapter.

NOTE: Do not connect MQJ 1 to the cable assembly under test. This connection is not performed until step 12.

- Step 8 - Mandrel wrap MQJ 1. Wrap MQJ 1 around a 6 mm (0.25 inch) mandrel after the connector mated pair with the SC-to-ST adapter.

NOTE: MJQ 1 should be wrapped around the mandrel until a dB value of 30 or higher is indicated on the LCD display. Ten mandrel wraps are usually sufficient to obtain this value.

NOTE: If a different value is displayed, then reconnect the ORLM jumper cable and MQJ 1 at the SC-to-ST adapter and redo this step. If this does not remedy the problem, then de-energize the ORLM and clean the ORLM jumper and MQJ 1 connections. If cleaning does not remedy the problem, then replace MQJ 1 and repeat this measurement step.

Step 9 - Reference the ORLM. Measure the termination reference. Press the [REF] key until the ORLM beeps once (This usually occurs in 2 seconds). During this period, the LCD display will indicate "REF". Wait for the ORLM to beep a second time.

NOTE: This step may be referred to as "terminating" the return loss signal before the mandrel wrap on MQJ 1 or referencing out the second connector interface on MQJ 1.

NOTE: The mandrel wrap must be maintained during the referencing process.

Step 10 - Unwrap MQJ 1 from the mandrel. Unwrap from the mandrel only after the second beep is heard.

Step 11 - Verify that the LCD is displaying a value between 14.3 dB and 15.9 dB.

NOTE: If a different value is displayed, then reconnect the ORLM jumper cable and MQJ 1 at the SC-to-ST adapter and redo steps 7 through 10. If this does not remedy the problem, then de-energize the ORLM and clean the ORLM jumper and MQJ 1 connections.

Step 12 - Connect the cable assembly under test to MQJ 1.

Step 13 -Connect MQJ 2 to the other end of the cable assembly under test.

NOTE: If the cable assembly contains termini that are not installed in a hermaphroditic connector, use the snap lock plug and receptacle to mate the MQJ terminus to the cable assembly terminus.

Step 14 -Mandrel wrap MQJ 2. Wrap MQJ 2 around a 6 mm (0.25 inch) mandrel.

NOTE: This step may be referred to as "terminating" the return loss signal after the cable assembly (two 2 connection interfaces) being measured or referencing out the second MQJ 2 connector interface.

Step 15 -Record the value displayed by the ORLM.

NOTE: The ORLM displays the return loss value. No keys need to be pressed prior to obtaining the measurement.

Step 16 -Detach MQJ 1 from the cable assembly under test.

Step 17 -Repeat steps 7 through 16 for the other single mode, single fiber cables on a multiple fiber cable assembly.

Step 18 -Verify the cable assembly return loss is acceptable per 3.3.3 for each fiber in the cable assembly.

3.3.3 Cable assembly acceptable return loss for two connection interfaces.

Step 1 - Compare the test results with table 7I1-II for the minimum acceptable return loss.

NOTE: The cable assembly is considered acceptable if the measured return loss is greater than or equal to the minimum acceptable return loss. If the measured return loss is acceptable, proceed to step 3 below. If the measured return loss is less than the minimum acceptable return loss, proceed to step 2 below.

Table 711-II Minimum acceptable return loss for one cable assembly

Cable assembly under test	Minimum acceptable return loss
Umbilical assembly (500ft)	28 dB for an assembly
Umbilical assembly (100ft)	28 dB for an assembly
Cable assembly (ST-to-termini)	28 dB for an assembly
Cable assembly (termini-to-termini)	28 dB for an assembly
Cross connect assembly	28 dB for an assembly
Pigtail assembly with ST's	28 dB for an assembly
Pigtail assembly without ST's	28 dB for an assembly

- Step 2 - If the measured return loss is 1 dB or more below the minimum acceptable return loss, reject the cable assembly. If the measured return loss is less than 1 dB below the minimum acceptable return loss, disconnect and clean all the connections and retest.
- Step 3 - If the cable is not going to be installed within 48 hours, install protective caps over the connectors/termini.

3.4 Procedure II. Method 711-2 Concatenated cable assemblies optical return loss measurement. Method 711-2 describes an optical test to determine the optical return loss for two or more concatenated cable assemblies (single mode fibers only).

3.4.1 Equipment and materials. The equipment and materials in table 711-I shall be used to perform cleaning prior to these procedures.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.4.2 ORLM (Optical Return Loss Meter) setup and optical return loss measurement. Perform the optical return loss measurement as follows:

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:**
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that the ORLM has been energized for at least 3 minutes to ensure stable performance before making measurements.

Step 1 - Energize the ORLM.

Step 2 - Select the optical return loss mode. Press the [Select Test] key until the "ORL" designator is selected by an arrow head on the LCD display.

Step 3 - Select the 1310 nm wavelength. Press the [λ] key until 1310 nm is selected.

Step 4 - Obtain the jumper cable supplied with the ORLM. Attach the APC SC connector to the ORLM optical connector interface port.

NOTE: Use appropriate configuration see figures 711-1 through 711-5.

NOTE: The connector with the green boot is the ORLM jumper cable end connected to the transmit port.

Step 5 - Attach the SC end of a SC-to-ST adapter to the other end of the ORLM jumper cable.

Step 6 - Select a MQJ for the two ends of the concatenated cable assemblies under test.

- a. Refer to table 7F1-IV to select the proper MQJ for the configuration that represents each end of the concatenated cable assembly under test.
- b. Place a loop, with a diameter of approximately one inch, in the MQJ 1 cable, or in each single fiber cable of a multiple fiber MQJ 1.

Step 7 - Connect an ST connector from MQJ 1 to the ST end of the SC-to-ST adapter.

NOTE: Do not connect MQJ 1 to the cable assembly under test. This connection is not performed until step 12.

Step 8 - Mandrel wrap MQJ 1. Wrap MQJ 1 around a 6 mm (0.25 inch) mandrel after the connector mated pair with the SC-to-ST adapter.

NOTE: MQJ 1 should be wrapped around the mandrel until a dB value of 30 or higher is indicated on the LCD display. Ten mandrel wraps are usually sufficient to obtain this value.

NOTE: If a different value is displayed, then clean the exposed end of MQJ 1. If this does not remedy the problem, then de-energize the ORLM and clean the ORLM jumper and MQJ 1 connections. If cleaning does not remedy the problem, then replace MQJ 1 and repeat this measurement step.

Step 9 - Reference the ORLM. Measure the termination reference. Press the [REF] key until the ORLM beeps once (This usually occurs in 2 seconds). During this period, the LCD display will indicate "REF". Wait for the ORLM to beep a second time.

NOTE: This step may be referred to as "terminating" the return loss signal before the mandrel wrap on MQJ 1 or referencing out the second connector interface on MQJ 1.

NOTE: The mandrel wrap must be maintained during the referencing process.

Step 10 - Unwrap MQJ 1 from the mandrel. Unwrap from the mandrel only after the second beep is heard.

Step 11 - Verify that the LCD is displaying a value between 14.3 dB and 15.9 dB.

NOTE: If a different value is displayed, de-energize the ORLM and clean the ORLM jumper and MQJ 1 connections.

Step 12 - Connect the matching end of the concatenated cable assemblies under test to MQJ 1.

Step 13 - Connect MQJ 2 to the other end of the concatenated cable assemblies under test.

NOTE: If the cable assembly contains termini that are not installed in a hermaphroditic connector, use the snap lock plug and receptacle to mate the MQJ terminus to the cable assembly terminus.

Step 14 - Mandrel wrap MQJ 2. Wrap MQJ 2 around a 6 mm (0.25 inch) mandrel.

NOTE: This step may be referred to as "terminating" the return loss signal after the concatenated cable assemblies being measured or referencing out the far end MQJ 2 connector interface.

Step 15 - Record the value displayed by the ORLM.

NOTE: The ORLM displays the return loss value. No keys need to be pressed prior to obtaining the measurement.

Step 16 - Detach MQJ 1 from the concatenated cable assemblies under test.

Step 17 - Repeat steps 7 through 16 for the other single mode, single fiber cables on multiple fiber concatenated cable assemblies.

Step 18 - Verify the concatenated cable assemblies return loss is acceptable per 3.4.3 for each fiber in the cable assembly.

3.4.3 Concatenated cable assembly acceptable return loss for entire run.

Step 1 - Verify that the test results are greater than or equal to 24 dB, the minimum acceptable loss for concatenated cable assemblies.

NOTE: The return loss for concatenated cable assemblies is considered acceptable if the measured return loss is greater than or equal to 24 dB, regardless of the number of cable assemblies being concatenated. If the measured return loss is acceptable, proceed to step 3 below. If the measured return loss is less than the minimum acceptable return loss, proceed to step 2 below.

Step 2 - If the measured return loss is 1 dB or more below the minimum acceptable return loss, reject the cable assembly. If the measured return loss is less than 1 dB below the minimum acceptable return loss, disconnect and clean all the connections and retest. If the return loss is still unacceptable, reterminate or replace the defective components.

Step 3 - If the cable is not going to be installed within 48 hours, install protective caps over the connectors/termini.

METHOD 7J

OPTICAL ACCEPTANCE TESTING OF PIERSIDE CONNECTIVITY MEASUREMENT QUALITY JUMPERS

1. SCOPE.

1.1 Scope. This method describes procedures for optical loss (attenuation) and optical reflectance testing of pierside connectivity, measurement quality jumpers (MQJs). Method 7J1-1 specifies an optical loss acceptance test for a hermaphroditic connector measurement quality jumper. Other pierside connectivity, measurement quality jumper configurations are to be acceptance tested for optical loss using Method 6F1 of this standard. Method 7J1-2 specifies the optical reflectance acceptance test for pierside connectivity, measurement quality jumpers. Optical reflectance testing is performed only on single mode cable assemblies or the single mode portion of a hybrid cable assembly.

2. REQUIRED EQUIPMENT AND MATERIALS.

2.1 The equipment and materials in the tables located in the applicable sections of this method shall be used to perform these procedures.

3. PROCEDURES.

3.1 Safety summary. The following safety precautions shall be observed:

a. Do not stare into the end of a fiber until verifying that the fiber is not connected to a laser light source or LED.

3.2 Cleaning. Perform cleaning per Method 7E1-1 of this standard prior to hermaphroditic connector mating and per Method 7E1-3 prior to connector de-mating.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

3.3 Procedure I. Method 7J1-1 hermaphroditic connector measurement quality jumper acceptance test for optical loss. This section describes test procedures for the acceptance for measurement quality jumpers. This method is to be used when individual ST connector to termini measurement quality jumpers and the hermaphroditic measurement quality jumper is assembled and tested at the same time.

3.3.1 Equipment and materials. The equipment and materials in table 7J1-I shall be used to perform this procedure:

TABLE 7J1-I. Equipment and materials.

Description	Quantity
LED source (NSN 7Z 6625 01 304 1739 or NAVSEA DWG 7325763-1B [item 6009BA] or equal)	8
Laser (LD) source (NAVSEA DWG 7325763-1B [item 6009BB] or equal)	4
Powermeter (NSN 7Z 6625 01 304 1739 or NAVSEA DWG 7325763-1B [item 6009BA] or equal)	1 or 12
MQJ, ST-to-ST connector, 1 meter length, multimode (NAVSEA DWG 7325763-1D [item 6009AX] or equal)	1
MQJ, ST-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1D [item 6009AY] or equal)	1
ST-to-ST adapter, single mode, split ceramic alignment sleeve, metal housing (NAVSEA DWG 7325763-1D [item 6007AB] or equal)	1
MQJ, Socket termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AJ] or equal)	2
MQJ, Pin termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AK] or equal)	2

TABLE 7J1-I. Equipment and materials (continued).

Description	Quantity
MQJ, Socket termini-to-ST connector, 1 meter length, multimode (NAVSEA DWG 7325763-1F [item 6009AL] or equal)	4
MQJ, Pin termini-to-ST connector, 1 meter length, multimode (NAVSEA DWG 7325763-1F [item 6009AM] or equal)	4
Hermaphroditic compatible, hermaphroditic receptacle, CID A-A-XX159, part CR-12-DI-A-12 (NAVSEA DWG 7325762 [item 6004AC])	1
Termini insertion tool, straight, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal)	1
Termini removal tool, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal)	1
Alignment sleeve insertion and removal tool, M29504 (NAVSEA DWG 7325763 [item 6009BH] or equal)	1
Tek wipes	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required

3.3.2 Procedure. Perform acceptance testing of candidate Measurement Quality Jumpers, candidate MQJs, as follows:

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:**
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that both the light source and power meter have been energized long enough to have stable performance before making measurements.
 4. The time delay between the P_1 measurement and the P_2 measurements shall be kept to a minimum to prevent inaccurate measurements.
 5. Identify and label the candidate MQJs (candidate jumpers) to be evaluated.
 6. Reference quality jumpers (RQJs) are cables constructed using fibers and connectors with tightened geometrical specifications (for example, diameter, concentricity). For more information on reference quality jumper cables, see EIA/TIA-455-171. The RQJ is of a higher quality (better optical component characteristics) than the MQJ and is used in the acceptance testing of an MQJ.

3.3.2.1 Loss test for ST connector end. The loss of the test jumper end with an ST connector is measured first.

- Step 1 - Connect the reference quality jumper (RQJ) between the light source and the power meter and record the reference power (P_1) at the meter in dBm (see figure 7F1-6). Disconnect the RQJ from the power meter.

NOTE: The value obtained for the reference power, P_1 , must be consistent from test to test. Changes in the reference power, P_1 , greater than 0.5 dB indicate a defective RQJ or an unstable light source. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

- NOTES:**
1. The time delay between the measurement of P_1 and P_2 shall be kept to a minimum to prevent inaccurate readings.
 2. The RQJ to light source connection shall not be disturbed between measurement of P_1 and P_2 to prevent inaccurate readings.

3. Use a single mode RQJ for single mode candidate MQJ acceptance testing. Use a multimode RQJ for multimode candidate MQJ acceptance testing.
 4. For single mode measurements, use a laser diode light source. For multimode measurements, use an LED light source.
 5. The RQJ configuration used in this section (3.3.2.1) has ST-to-ST connections. The RQJ configuration used in 3.3.2.3 has ST-to-terminus connections. This latter RQJ is identified as a ST-to-terminus RQJ for clarity.
- Step 2 - Connect the candidate MQJ to the RQJ using a single-mode ST-to-ST adapter and to the power meter using the applicable power meter adapter head (see figure 7F1-6).

NOTE: Ensure power meter used has a wide area detector.

- Step 3 - Record the test power at the meter (P_2).

NOTE: A test power, P_2 , greater the reference power, P_1 , or greater than a zero reference level indicates an improper measurement. In general, this may be caused by a defective or dirty RQJ used for the reference measurement. The measurement is invalid. Clean or replace the RQJ and repeat the measurement.

- Step 4 - Calculate the ST connector loss using the following formula:

$$B_{ST} = (P_1 - P_2)$$

Where: B_{ST} = ST connector loss in dB
 P_1 = Reference power in dBm
 P_2 = Test power in dBm

- Step 5 - Record the ST connector loss along with the candidate MQJ identification.
- Step 6 - Disconnect, then reconnect, the candidate MQJ from the RQJ.
- Step 7 - Repeat steps 3 through 6 ten times for the candidate MQJ. Use a wipe dampened with alcohol to clean the adapters/connectors and blow them dry with air before making each connection.
- Step 8 - Verify that the ST connector losses are acceptable using 3.3.2.4.
- Step 9 - Repeat step 1 through step 8 for the other candidate MQJs that will comprise the hermaphroditic MQJ. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making each connection.

3.3.2.2 Assemble the hermaphroditic MQJ. Assemble the hermaphroditic MQJ at this point in the test process. Place the termini ends of each test jumper into the hermaphroditic cable plug. The strain relief operation may be performed at a later point after it is verified that the loss is within the specified limit.

NOTE: The assembled hermaphroditic MQJ is identified as the candidate hermaphroditic MQJ.

3.3.2.3 Loss test for termini end. The loss of the candidate MQJ termini are measured next.

- Step 1 - Connect each ST-to-terminus RQJ between the light source and the power meter using the applicable power meter adapter head (see figure 7F1-2).

- Step 2 - Record the reference power at the meter (P_1) in dBm for each ST-to-terminus RQJ.

Note: The value obtained for the reference power, P_1 , must be consistent from test to test. Changes in the reference power, P_1 , greater than 0.5 dB indicate a defective MQJ or an unstable light source. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 3 - Disconnect the terminus end of the ST-to-terminus RQJ from the power meter.

- NOTES:
1. The time delay between the measurement of P_1 and P_2 shall be kept to a minimum to prevent inaccurate readings.
 2. The ST-to-terminus RQJ to light source connection shall not be disturbed between measurement of P_1 and P_2 to prevent inaccurate readings.
 3. Use a single mode RQJ for single mode candidate MQJ acceptance testing. Use a multimode RQJ for multimode candidate MQJ acceptance testing.
 4. For single mode measurements, use a laser diode light source. For multimode measurements, use an LED light source.
 5. Twelve separate light sources or two light sources with a switching system are to be used. One power meter may be used.

Step 4 - Using the termini insertion tool, place the terminus end of each ST-to-terminus RMJ into the appropriate cavity of the hermaphroditic receptacle insert.

NOTE: This assembly is identified as the receptacle RQJ.

Step 5 - Connect the candidate hermaphroditic MQJ to the receptacle RQJ.

Step 6 - Connect the ST connector end of each candidate MQJ in the candidate hermaphroditic MQJ to the appropriate adapter on the power meter.

Step 7 - Record the test power at the meter (P_2) in dBm for each candidate MQJ.

NOTE: A test power, P_2 , greater the reference power, P_1 , or greater than a zero reference level indicates an improper measurement. In general, this may be caused by a defective or dirty MQJ used for the reference measurement. The measurement is invalid. Clean or replace the MQJ and repeat the measurement.

Step 8 - Calculate each terminus connection loss using following formula

$$B_C = (P_1 - P_2)$$

Where: B_C = Terminus connection loss in dB
 P_1 = Reference power in dBm
 P_2 = Test power in dBm

NOTE: The terminus connection loss must be calculated using the correct reference power. The ST-to-terminus RQJ which corresponds to each candidate MQJ position must be tracked throughout the procedure.

Step 9 - Record each terminus connection loss along with each candidate MQJ identification.

Step 10 - Disconnect, then re-connect, the candidate hermaphroditic MQJ from the receptacle RQJ.

Step 11 - Repeat step 7 through step 10 for a total of ten times.

Step 12 - Verify that the terminus connection losses are acceptable using 3.3.2.4.

Step 13 - Record the terminus connection losses with the corresponding average connection loss and standard deviation of each candidate MQJ along with the insert position identification.

3.3.2.4 Acceptance criteria.

Step 1 - Calculate the mean loss for each end of each candidate MQJ using the following formula and record the results:

$$m_c = \frac{1}{10} \times \sum_{n=1}^{10} B_{cn}$$

Where: μ_c = Mean terminus connection loss in dB
 B_{cn} = Connection loss for measurement n in dB

Step 2 - Calculate the standard deviation of the measured loss for each candidate MQJ using the following formula and record the results:

$$s_c = \sqrt{\frac{\sum_{n=1}^{10} (B_{cn} - m_c)^2}{9}}$$

Where: σ_c = Standard deviation of the connection loss in dB

Step 3 - A candidate MQJ is acceptable if the mean loss and the standard deviation of the loss of each end is in accordance with Table 7J1-II. A candidate hermaphroditic MQJ is acceptable if the mean loss and the standard deviation of the loss for every candidate MQJ in the candidate hermaphroditic MQJ is in accordance with Table 7J1-II.

NOTE: For jumper cables which are in excess of 1 m in length, the loss of the fiber can be added to the following acceptable loss limits.

TABLE 7J1-II. Test jumper loss acceptance criteria.

End connection	Acceptable loss (dB)	Multimode Standard deviation (dB)	Multimode Standard deviation (dB)
MIL-C-83522/16	$0.05 \leq B_{ST} \leq 0.35$	0.1 max	0.05 max
CID A-A-XX160 pin terminus	$0.00 \leq B_c \leq 0.50$	0.1 max	0.05 max
CID A-A-XX160 socket terminus	$0.00 \leq B_c \leq 0.50$	0.1 max	0.05 max

Step 4 - If the mean loss or the standard deviation of either end is not in accordance with Table 7J1-II, the candidate hermaphroditic MQJ shall not be used as an MQJ.

3.4 Procedure II. Method 7J1-2 measurement quality jumper acceptance test for optical reflectance. This section describes the optical reflectance test procedure for the acceptance of pierside connectivity, measurement quality jumpers (MQJs).

NOTE: This optical reflectance measurement can be performed at one connection interface since at least one end of the candidate MQJ has at least 46 m (18 inch) length of exposed and accessible single fiber cable.

3.4.1 Equipment and materials. The equipment and materials in table 7I1-III shall be used to perform cleaning prior to these procedures.

CAUTION: Throughout the termination process, cleanliness is critical to obtaining a high optical quality connector. Make sure that your hands and the work area are as clean as possible to minimize the ingress of dirt into the connector parts.

TABLE 7J1-III. Equipment and materials.

Description	Quantity
ORLM (Optical Return Loss Meter) (Noyes Fiber Systems Model ORL 3 or equal)	1
MQJ, ST-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1D [item 6009AY] or equal)	2
SC-to-ST adapter, single mode, split ceramic alignment sleeve, metal housing (NAVSEA DWG 7325763-1D [item 6007BE] or equal)	2
ST-to-ST adapter, single mode, split ceramic alignment sleeve, metal housing (NAVSEA DWG 7325763-1D [item 6007AB] or equal)	2
MQJ, hermaphroditic cable plug to ST connector, 1 meter length (NAVSEA DWG 7325763-1E [item 6009AQ] or equal)	2
MQJ, Socket termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AJ] or equal)	2
MQJ, Pin termini-to-ST connector, 1 meter length, single mode (NAVSEA DWG 7325763-1F [item 6009AK] or equal)	2
Snap lock, plug, termini-to-termini connection device (NAVSEA DWG 7325763-1F [item 6009AP] or equal)	2
Snap lock, receptacle, termini-to-termini connection device (NAVSEA DWG 7325763-1F [item 6009AR] or equal)	2
Termini insertion tool, straight, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal)	1
Termini removal tool, M29504 (NAVSEA DWG 7325763 [item 6009BF] or equal)	1
Alignment sleeve insertion and removal tool, M29504 (NAVSEA DWG 7325763 [item 6009BH] or equal)	1
Tek wipes	As required
Alcohol bottle with alcohol/2-propanol or equal (sealable type)	1
Canned air or compressed air	As required

3.4.2 ORLM (Optical Return Loss Meter) setup and optical reflectance measurement. Perform the optical reflectance measurement as follows:

WARNING: Do not stare into the end of an optical fiber connected to an LED or laser diode. Light may not be visible but can still damage the eye.

- NOTES:**
1. Ensure the test equipment calibration is current.
 2. Use a wipe dampened with alcohol to clean the adapters/connectors and wipe them dry with a clean, lint free, cotton (100%) cloth before making the connections.
 3. Make sure that the ORLM has been energized for at least 3 minutes to ensure stable performance before making measurements.

FIGURE 7J1-3. Optical loss MQJ acceptance test: Cable plug-to-ST configuration>
(example: hermaphroditic MQJ).

Step 1 - Energize the ORLM.

Step 2 - Select the optical return loss mode. Press the [Select Test] key until the "ORL" designator is selected by an arrow head on the LCD display.

Step 3 - Select the 1310 nm wavelength. Press the [λ] key until 1310 nm is selected.

Step 4 - Obtain the jumper cable supplied with the ORLM. Attach the APC SC connector to the ORLM optical connector interface port.

NOTE: The connector with the green boot is the ORLM jumper cable end connected to the transmit port.

Step 5 - Attach the SC end of a SC-to-ST adapter to the other end of the ORLM jumper cable.

Step 6 - Select the appropriate RQJ for each end of the cable assembly under test.

NOTE: Reference quality jumpers (RQJs) are cables constructed using fibers and connectors with tightened geometrical specifications (for example, diameter, concentricity). For more information on reference quality jumper cables, see EIA/TIA-455-171. The RQJ is of a higher quality (better optical component characteristics) than the MQJ and is used in the acceptance testing of a candidate MQJ.

a. Refer to table 7F1-IV to select the proper RQJ for each cable assembly configuration.

- b. Place a loop, with a diameter of approximately one inch, in the cable of each RQJ, or in each single fiber cable of each multiple fiber RQJ.

Step 7 - Connect an ST connector from RQJ 1 to the ST end of the SC-to-ST adapter.

NOTE: Do not connect RQJ 1 to the candidate MQJ under test. This connection is not performed until step 12.

Step 8 - Mandrel wrap RQJ 1. Wrap RQJ 1 around a 6 mm (0.25 inch) mandrel after the connector mated pair with the SC-to-ST adapter.

NOTE: RQJ 1 should be wrapped around the mandrel until a dB value of 30 or higher is indicated on the LCD display. Ten mandrel wraps are usually sufficient to obtain this value.

NOTE: If a different value is displayed, then reconnect the ORLM jumper cable and RQJ 1 at the SC-to-ST adapter and redo this step. If this does not remedy the problem, then de-energize the ORLM and clean the ORLM jumper and RQJ 1 connections. If cleaning does not remedy the problem, then replace RQJ 1 and repeat this measurement step.

Step 9 - Reference the ORLM. Measure the termination reference. Press the [REF] key until the ORLM beeps once (This usually occurs in 2 seconds). During this period, the LCD display will indicate "REF". Wait for the ORLM to beep a second time.

NOTE: This step may be referred to as "terminating" the return loss signal before the mandrel wrap on RQJ 1 or referencing out the second connector interface on MQJ 1.

NOTE: The mandrel wrap must be maintained during the referencing process.

Step 10 -Unwrap RQJ 1 from the mandrel. Unwrap from the mandrel only after the second beep is heard.

Step 11 -Verify that the LCD is displaying a value between 14.3 dB and 15.9 dB.

NOTE: If a different value is displayed, then clean the exposed end of MQJ 1. If this does not remedy the problem then de-energize the ORLM and clean the ORLM jumper and RQJ 1 connections.

Step 12 -Connect RQJ 1 to the end of the candidate MQJ under test.

NOTE: If the candidate MQJ contains termini that are not installed in a hermaphroditic connector, use the snap lock plug and receptacle to mate the RQJ terminus to the candidate MQJ terminus.

Step 14 -Mandrel wrap the candidate MQJ. Wrap the candidate MQJ cable around a 6 mm (0.25 inch) mandrel.

NOTE: This step may be referred to as "terminating" the return loss signal after the first candidate MQJ (one connection interface) being measured or referencing out the MQJ connector interface at the opposite end.

Step 15 -Record the value displayed by the ORLM.

NOTE: The ORLM displays the reflectance value. No keys need to be pressed prior to obtaining the measurement.

Step 16 -Detach RQJ 1 from the candidate MQJ.

Step 17 -Repeat steps 7 through 16 for the other single mode, single fiber cables on a multiple fiber candidate MQJ.

Step 16 -Redo steps 7 through 17 to obtain the reflectance value for the connection interface at the other end of the candidate MQJ.

Step 17 -Verify the candidate MQJ return loss per 3.4.3 for each connection interface in the candidate MQJ.

3.4.3 Candidate MQJ acceptable reflectance for each connection interface.

Step 1 - Compare the test results with table 7J1-IV for the range of acceptable return loss.

NOTE: The candidate MQJ is considered acceptable if the measured return loss is within the acceptable return loss range. If the measured return loss is acceptable, proceed to step 3 below. If the measured return loss is not within the acceptable return loss range, proceed to step 2 below.

Table 7J1-IV Acceptable reflectance range per connection interface.

Cable assembly under test	Acceptable reflectance range
ST interface	-30 dB to -40 dB at each interface
Terminus interface	-30 dB to -40 dB at each interface
Hermaphroditic connector interface	-30 dB to -40 dB at each interface

Step 2 - If the measured reflectance is 1 dB or more outside the acceptable reflectance range, reject the candidate MQJ. If the measured reflectance is above the maximum acceptable reflectance, reject the candidate MQJ. If the measured reflectance is less than 1 dB outside the acceptable reflectance range, disconnect and clean all the connections and retest.
